**ABOUT UNEP-WORLD CONSERVATION  
MONITORING CENTRE**

The UNEP World Conservation Monitoring Centre (UNEP-WCMC), based in Cambridge, UK, is the specialist biodiversity information and assessment centre of the United Nations Environment Programme (UNEP), run cooperatively with WCMC 2000, a UK charity. The Centre's mission is to evaluate and highlight the many values of biodiversity and put authoritative biodiversity knowledge at the centre of decision-making. Through the analysis and synthesis of global biodiversity knowledge the Centre provides authoritative, strategic and timely information for conventions, countries and organisations to use in the development and implementation of their policies and decisions.

The **UNEP-WCMC** provides objective and scientifically rigorous procedures and services. These include ecosystem assessments, support for the implementation of environmental agreements, global and regional biodiversity information, research on threats and impacts, and the development of future scenarios.

**CITATION**

## Introduction

This report, the eighteenth produced by UNEP-WCMC for the International Alligator and Crocodile Trade Study (IACTS), examines the international trade in crocodylian skins, with a particular focus on the years 2007 to 2009. It also attempts to identify problem areas and to recommend, where possible, workable solutions. As in previous reports, the data used have been obtained from the CITES Trade Database that UNEP-WCMC maintains on behalf of the CITES Secretariat, with additional information provided by the Crocodile Farmers Association of Zimbabwe and Mainland Holdings in Papua New Guinea.

As in previous IACTS reports, this report presents an overview of global trade levels in classic skins (alligators and true crocodiles) and caimans, a detailed species-by-species analysis of the trade in skins and also trade in other products such as live animals and meat. All species within the family Crocodylia are listed in either Appendix I or II of CITES. Of those species specifically mentioned in this report, the following are listed in Appendix I: *Crocodylus moreletii*, *C. niloticus*, *C. porosus*, *C. rhombifer*, *C. siamensis*, *Osteolaemus tetraspis*, *Caiman latirostris*, and *Melanosuchus niger*, although some of these species have populations listed in Appendix II.

## Data included

This report is based on an analysis of the annual reports submitted by the Parties to CITES for all years up to 2009 and, if applicable, 2010. A list of annual reports for 2007-2009 that had been received by UNEP-WCMC at the time of writing (September 2011) is provided (Table 1).

All direct trade in whole skins and sides of crocodylian species has been analysed, with two sides being considered to be equivalent to one skin. Trade in skins reported in units of weight, area, length or sub-units, such as 'tails', has been excluded. Wherever possible, data reported by the producer countries have been used in preference to that reported by importing countries because the time lag between export and import, may lead to double-counting and thus an overestimation of trade volume. However, where producer countries have failed to submit annual report data on exports of crocodylians, importers' data have been used. Many of the transactions have been analysed at the export permit level. As with previous reports that covered the years 1995-2008, re-export trade has not been included in the estimation of annual production.

The report discusses the species in taxonomic order. The figures and tables contain trade information from all sources, including captive-bred, ranched and wild specimens, unless otherwise specified.

## Limitations of data

Incomplete data due to late submission or failure to submit CITES annual reports remains an impediment to conducting trade studies using CITES trade data. Measures have been taken by the CITES Standing Committee to improve compliance with the reporting provisions of the Convention. These include reminders being sent by the Secretariat on behalf of the Standing Committee and a recommendation to suspend trade in CITES-listed species should a Party fail, without providing sufficient justification, to submit reports for three consecutive years (Resolution Conf. 11.17 (Rev. CoP14)). Despite these efforts, some Parties fail to submit annual reports on a regular basis.

According to Resolution Conf. 11.17 (Rev. CoP14), annual reports for trade in 2009 should have been submitted by 31 October 2010. However, at the time of writing, several reports that might contain important crocodylian data have still not been received by the CITES Secretariat. These include Bolivia (2008 and 2009), Ethiopia (2008 and 2009), Guyana (2009), Japan (2009), Nicaragua (2009) and United Republic of Tanzania (2007).

Key: ✓ = report available; - = report not received

The accuracy of the data provided in CITES annual reports is a further limitation to analysis of the trade. The quality of some reports was lacking and cross-referencing of importer data was needed to ensure accuracy of analysis. Occasionally skins have been misreported as live animals, while skin pieces, such as back strips, necks, flanks and tails, have been reported as whole skins. Care has been taken to reduce this source of error to a minimum by closely cross matching the import data with the original export permit information and the results are discussed in the various species accounts.

Most CITES annual reports are compiled on a shipment-by-shipment basis and many include the exporters' permit numbers. This allows for cross-checking of data and enables potential reporting or typographical errors to be traced. This type of checking is particularly useful for cross-referencing end-of-year trade where an export may be reported in one year and the import of the same shipment reported the following year. In recent years, the majority of countries trading in crocodylian skins have reported on a shipment-by-shipment basis.

Analysing annual reports is also complicated by the inconsistent way in which the reports are compiled. According to CITES Notification to the Parties No. 2011/019 of 17 February 2011, Parties may report on the basis of the permits and certificates that have been issued if they are unable to report on the actual number of specimens that entered or left the country. However, reporting on the basis of permits issued may lead to overestimates of trade volume as permits are frequently issued for quantities in excess of those actually traded and indeed, some of the permits may expire without being used. Despite frequent reminders from the CITES Secretariat, the majority of Parties still do not provide any details concerning the basis on which their annual reports are compiled.

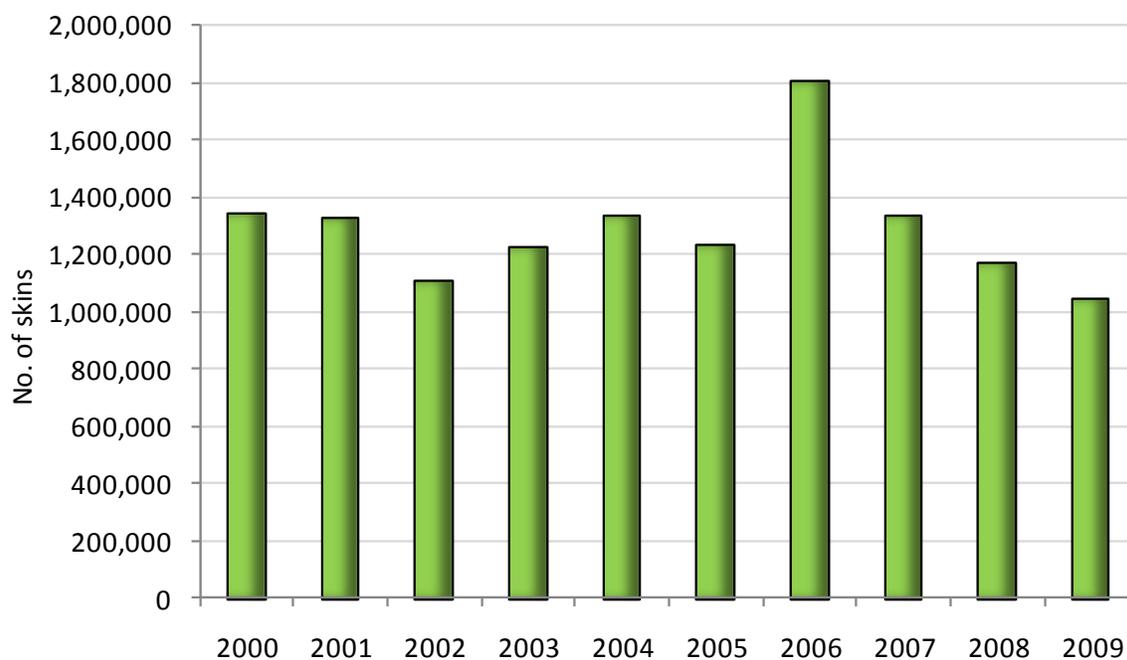

Significant improvement in the reporting of crocodylian trade continues; however, the absence of annual reports from some of the producer countries continues to be a hindrance to timely analysis of the trade.

## Overview of global trade in crocodilian skins

The overall volume of world trade in classic crocodilian skins and caimans has been variable over the ten-year period 2000 to 2009, with an average of 1.3 million skins exported annually (Table 2; Figure 1). The data provided are based, wherever possible, on country of export data. There are slight uncertainties regarding figures for the overall totals because of the lack of annual report data from certain key countries mentioned above. However, it is hoped that the estimates made using import country data are sufficient to indicate close approximations to actual exports.

**Table 2. Reported global trade in crocodilian skins 2000-2009**

**Figure 1. Global exports of crocodilian skins, 2000-2009**

Overall the total number of skins entering international trade in 2009 was approximately 1.05 million, a further decrease in trade volume to the lowest level in the last decade. The most recent decline appears to be the result of greatly reduced exports of *Caiman crocodilus fuscus* skins from Colombia.

The species composition of the trade in skins varied over the ten year period 2000-2009. Some diversification in the species in trade began in 2001 with two different species entering the market: captive-bred *Crocodylus acutus* from Colombia and Honduras and *Caiman latirostris* from Argentina and Brazil. Trade in these species continues and appeared to be increasing in the case of *C. acutus*; however, the increase was not continued in 2009. The first exports in recent years of wild *Caiman crocodilus crocodilus* skins from Guyana occurred in 2001 and continued through 2009, while 2005 saw the first exports of ranched *Caiman yacare* from Argentina. The steady increase in exports of *Alligator mississippiensis* from the United States of America between 2002 and 2006 was not sustained in the following two years, with exports falling by over 40 per cent over this period. The reasons for this decline are unclear, but there may have been decreased nesting in 2006 as a result of two major hurricanes in 2005 that were followed by a drought, trapping highly saline waters across most of coastal Louisiana (Don Ashley *pers. comm.*). The general global financial crisis may also have been a factor. Exports of *Crocodylus niloticus* appear to have remained steady at between 140,000 and 170,000 skins yearly since 2000 with Madagascar, South Africa, Zambia and Zimbabwe being the main suppliers. The political unrest in Zimbabwe has no doubt had an effect on the crocodile farming industry in that country, but continent-wide production is up in several countries. *Crocodylus novaeguineae* production appears to have decreased after 2006 while there has been a

corresponding increase in that of *C. porosus*, perhaps suggesting a change in market preference. Thailand's exports of *C. siamensis*, which had ranged between 1,679 and 5,459 between the mid 1990s and 2002 has since showed a steady increase to over 39,000 in 2008 and Viet Nam also exported significant numbers of skins of this species between 2005 and 2008. Both countries reported notably fewer exports in 2009 compared with the quantities reported in 2008.

Trade in caiman skins peaked in 2000 at almost 900,000 skins but then fell by 30 per cent between 2001 and 2002. A slight recovery was seen in the three years that followed, particularly as a result of increased exports from Bolivia and Venezuela, but then in 2006 Colombia alone exported nearly a million skins, an increase of 40 per cent over the previous year. The trade in 2007 and 2008 showed a return to the levels seen in the previous five years but fell again in 2009.

The following sections provide a more detailed look at each species and the primary exporter countries involved in the skin trade.

## Species accounts

### *Crocodylus acutus* American crocodile

**Colombia** has five farms registered with CITES for production of this Appendix I species. Skin exports began in 2003 with 130 skins from captive-bred animals going to France. Exports of small numbers of skins have continued ever since, rising to 410 in 2009. Almost all of the skins exported by Colombia between 2007 and 2009 were imported by Italy, with one going to Japan and nine to Singapore in 2009.

**Honduras** has one registered breeding operation for this species and the first reported trade was of 500 skins imported by Japan in 2003. This was followed by exports of 197 skins to Panama in 2004 that were apparently subsequently re-exported back to Honduras. In 2005, Honduras reported exporting 76 skins and a further 111 in 2006. Exports fell to just 54 skins in 2007, but none were confirmed by the importers. Annual reports from Honduras show an increase in exports to 1,004 skins in 2008 and a further increase to 1,050 skins in 2009. Panama has been the main importer, although 150 skins went to El Salvador in 2009.

### *Crocodylus johnsoni* Australian freshwater crocodile

Exports of *Crocodylus johnsoni* from **Australia** peaked at 3,875 skins in 1993, remained at this level until 1996, then fell to insignificant levels thereafter. No direct exports in skins of this species were reported in 2001 or 2004 and only two, exported to Japan, in 2002. Although Japan reported the import of 184 skins in 2003, the format of the export permit numbers would suggest the trade was in manufactured products rather than whole skins. In 2005, Singapore reported re-exporting 1,594 skins to China, but the country of origin permit numbers suggest these were skins that had been stockpiled since 1993 and 1994 and were not evidence of new

exports from Australia. In 2005, Australia reported exporting 44 skins from wild-caught individuals and 21 from captive-bred animals to Singapore, and the exports were confirmed by Singapore. No further trade in skins has been reported since 2005.

### *Crocodylus moreletii* Morelet's Crocodile

**Mexico** has three captive-breeding operations for this species registered with the CITES Secretariat. Exports began in 1996 with just 10 skins and were followed by low levels of exports increasing to 2,430 in 2001 (Figure 2). Exports subsequently decreased and have remained below 1,000 per annum since then. According to Mexican export data, only 16 skins were exported in 2007 and although a further 40 were reported as an import by Japan a check of the permit number revealed that these skins were reported as exports by Mexico in 2006. In 2008, Mexico reported exporting 724 skins, mostly to the Republic of Korea, and in 2009 485 skins were reported exported, mostly to Japan. The population in Mexico was listed in CITES Appendix II on 23 June 2010 with a zero quota for wild specimens traded for commercial purposes.

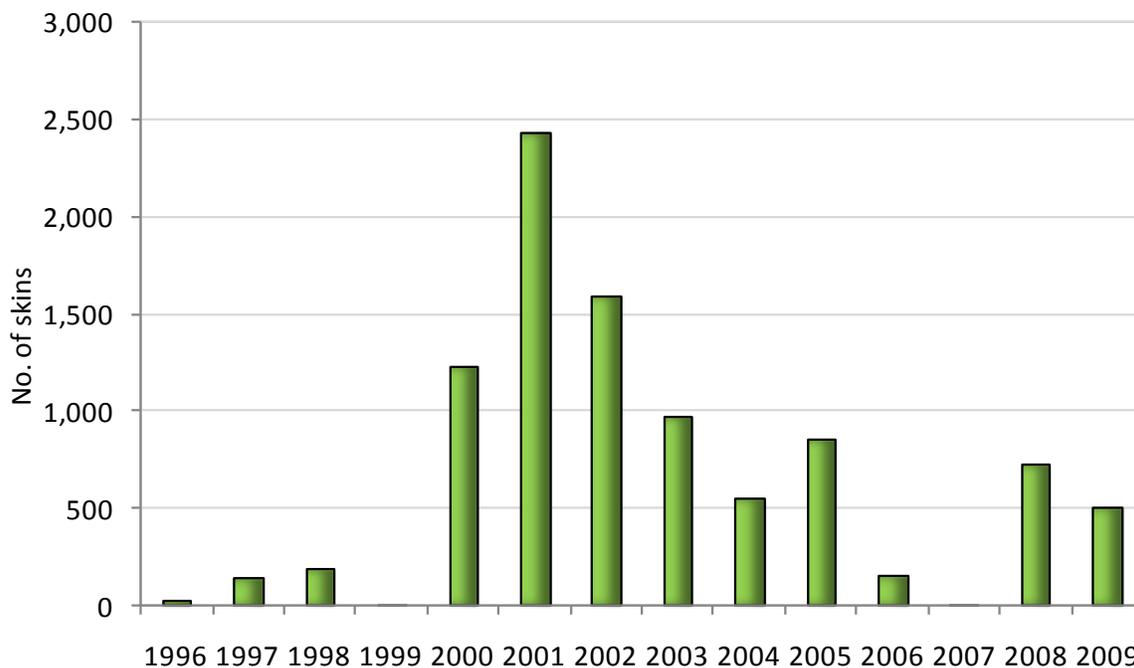

Figure 2. Exports of *Crocodylus moreletii* skins as reported by Mexico, 1996–2009

### *Crocodylus niloticus* Nile crocodile

Over the period 2002-2009, an average of 156,000 *Crocodylus niloticus* skins were exported globally (Table 3). The section that follows summarises information on exports by both range states and other notable exporters. Currently, only two countries have captive-breeding operations registered with the CITES Secretariat: Mali and Senegal, each with only one registered operation. *Crocodylus niloticus* is listed in CITES Appendix I except for the populations of Botswana, Egypt, Ethiopia, Kenya, Madagascar, Malawi, Mozambique,

Namibia, South Africa, Uganda, Tanzania, Zambia and Zimbabwe, which are included in Appendix II.

**Table 3. Reported trade in *Crocodylus niloticus* skins, 2002-2009**

Country	2002	2003	2004	2005	2006	2007	2008	2009

Key: \* Figure derived partly or in full from import data; ◆ Data supplied by CFAZ

### 1. Exports by range States

**Botswana:** Although Botswana reported exports of over 9,000 skins between 1992 and 1994, no commercial exports of skins were reported by Botswana between 1997 and 2008 and no report has been received from Botswana for 2009. However, South Africa reported importing skins from individuals captive-bred in Botswana in 2001 (152 skins), 2008 (374 skins) and 2009 (1,626 skins), as well as 320 ranched skins in 2007.

**Central African Republic:** There have been no commercial exports from the Central African Republic since 1986.

**Congo:** Small numbers of skins were exported to France during the 1980s, but there have been no commercial exports reported since 1989.

**Ethiopia:** The sole crocodile operation (Arba Minch Crocodile Ranch), is owned and managed by the Ethiopian Wildlife Conservation Organisation (EWCO) which also acts as both the CITES Management and Scientific Authorities. The ranch, however, is not currently registered

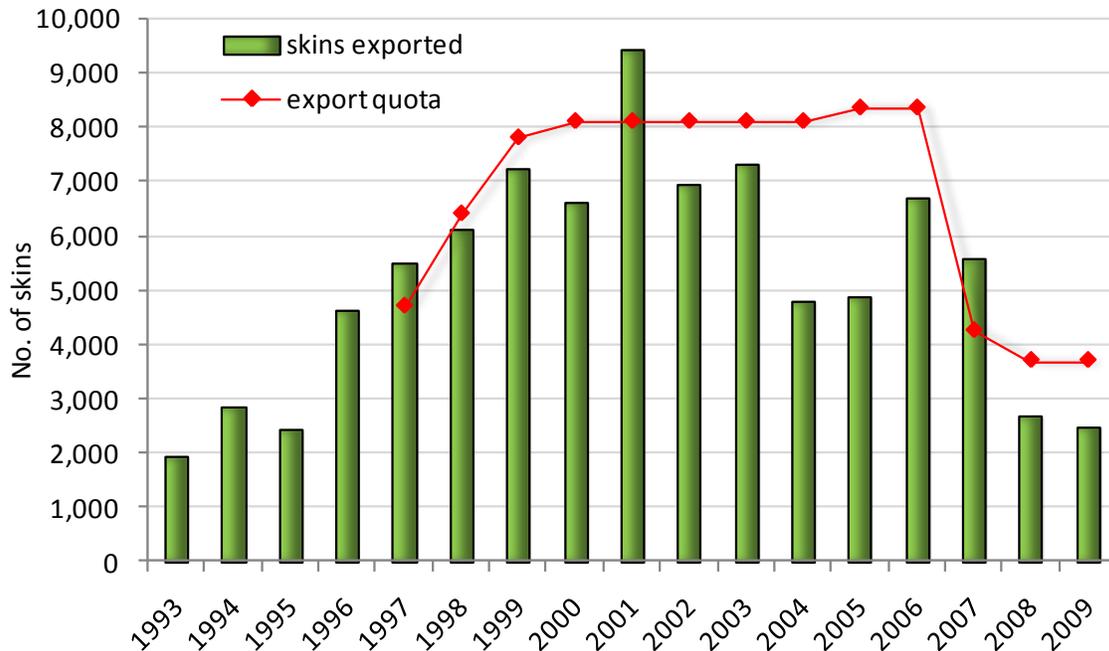

with the CITES Secretariat. Production appears to be erratic and there are discrepancies between the information contained in Ethiopia's annual reports to CITES, data received directly from EWCO, and information from importing countries. Data provided by EWCO have been used in Table 3 for the period 2001 to 2006 and for 2008 in preference to Ethiopian annual report data as they are more comparable with data reported by importers; however, no EWCO data were available for 2007 and the Ethiopian annual report for that year was incomplete so the data from France were used. No annual report has been received from Ethiopia for 2009, but no countries reported importing any skins. A report was submitted by Ethiopia for 2010; it recorded the export of four ranched skins.

**Guinea:** Guinea has not reported exporting skins since 1991, nor have there been any reported imports from that country apart from a seizure of 100 skins reported by Spain in 1995.

**Kenya:** Kenya reported exporting 6,354 skins in 2007; 4,504 in 2008 and a further 4,283 skins in 2009, all but two of which went to Singapore. In 2006, the skins were reported to be from captive-bred animals and in 2007 the source was roughly half ranched, half captive-bred, which suggests the differences between the two sources may be poorly understood by the Management Authority. In 2008 and 2009, all were reported to be ranched. A report of May 2006 identifies six crocodile farms in Kenya, one of which only conducted ranching, two only captive-breeding, and three both captive-breeding and ranching (<http://www.cites.org/common/resources/reports/ranch/KE0605.pdf>).

**Liberia:** Commercial exports of skins from Liberia have not been reported in trade since 1984.

**Madagascar:** Madagascar's exports showed an overall decrease between 2001 and 2009 from 9,408 skins in 2001 to 2,450 skins exported in 2009, reaching the lowest level since 1995 (Figure 3). This is a decrease of approximately 56 per cent compared to the 5,550 skins exported in 2007. The situation in Madagascar has long been under review by both the IUCN/SSC Crocodile Specialist Group and the CITES Secretariat. Based on serious concerns raised about the trade, the CITES Standing Committee recommended Parties to suspend trade in *C. niloticus* on 17 June 2010 until further notice (See Notification to the Parties No. 2010/015).

**Figure 3. Exports of *Crocodylus niloticus* skins from Madagascar, 1993 - 2009**

**Malawi:** In 2007, Malawi reported exporting 1,287 skins, with 215 reported as wild-sourced and the remainder ranched. A total of 3,370 skins, the majority ranched, were reported exported by Malawi in 2008, 200 of which were from wild-caught animals. The same number of wild skins were reported as exports in 2009, although the overall quantity of skins decreased by 23 per cent to 2,603. Most of the skins were reported as exports to Italy between 2007 and 2009.

**Mali:** Mali has one captive-breeding operation registered with the CITES Secretariat - Ets Lassana Diaby Cuir et Peaux that was reportedly established in 1978, but was only registered with CITES in May 2008. In 2008, Mali reported exports of 107 source 'D' skins to France who confirmed the trade. No exports of skins were reported by Mali in 2009.

**Mozambique:** In 2007, Mozambique reported just one export of 179 skins of wild nuisance animals to South Africa who confirmed the transaction. In 2008, Mozambique reported exports of 503 skins from wild-caught animals to South Africa and 63 ranched skins to France. These last two transactions were also confirmed by the importers. No commercial shipments of skins were reported in 2009.

**Namibia:** No report has been received from Namibia for 2007, although one has been submitted for 2008. However, the 2008 annual report did not include any reports of exports of crocodile skins from Namibia and none were reported by importing countries in that year. In 2009, Namibia reported exporting 600 skins from captive-bred animals to South Africa who confirmed the trade.

**Nigeria:** No commercial shipments from Nigeria have been reported since 1983, although seizures of items from tourists returning from that country occur regularly.

**Senegal:** There is one farm registered with the CITES Secretariat for captive-breeding of this species that was established in 1995. The only trade appears to have been two skins exported to Ukraine in 2006 and one to France in 2008.

**Somalia:** No commercial shipments have been reported from Somalia since 1981. A CITES trade suspension has been in place for all trade from Somalia since 2002 on the basis of lack of submission of annual reports. National legislation suspending all commercial trade was also put in place in 2004.

**South Africa:** In 2007, South Africa reported exporting 30,514 skins and another 5,500 skins from animals bred in Mozambique; in 2008, a further 40,197 skins were reported as direct exports by South Africa plus 4,500 skins captive-bred in Mozambique. Note that all of the additional skins that were recorded as re-exports by South Africa were from animals imported as hatchlings and juveniles from Mozambique and the trade is not included in Mozambique's skin export data. South Africa's annual report for 2009 indicates commercial exports of 24,988 skins, 92 per cent from captive-bred animals, the remainder ranched. No skins from animals originating in Mozambique were reported in that year. It should also be noted that South Africa has been a major re-exporter of skins produced in Zambia and Zimbabwe in the past, but most of these are now exported directly by the producer countries.

**Sudan:** There has been no commercial trade in skins originating in Sudan since 1992.

**Togo:** No trade in skins has been reported since the early 1980s when 6,377 were exported to France.

**Uganda:** Uganda submitted their missing annual reports for 2006-2009 in February 2010 but no exports of crocodile skins were included. However, the Republic of Korea reported importing 300 skins in 2006 and 290 skins in 2008. All skins imported in 2006 were reported to be from captive-bred specimens, but those in 2008 were reported to be from the wild. No skins from Uganda were reported as imports in 2009.

**United Republic of Tanzania:** Tanzania states that their annual report represents actual trade; however, major discrepancies between Tanzania's reports and the data provided by importers indicate that Tanzania may not have included all of their crocodile export data in their annual reports between 2002 and 2008. Therefore, the figures in this report have been taken from the reports of the major importing countries, notably Singapore and Italy for those years (Table 3). According to importer-reported data, skin exports from Tanzania have increase from 1,100 in 2006 to 1,784 in 2008, all skins being of wild origin. No report has been received from Tanzania for 2007, although one has been submitted for 2008 and 2009. In 2009, Tanzania reported commercial exports of 1,365 skins, all of wild origin, and all but one going to Singapore.

**Zambia:** In 2007, Zambia reported exporting 37,305 skins, but France and Singapore reported a further 7,292 skins on permits that were not in Zambia's annual report. Assuming this trade reported by importers did occur, the probable level of export from Zambia was 44,597 in 2007. This discrepancy did not occur in 2008 or 2009 when Zambia reported exports of 28,917 and 43,655 skins, respectively, mostly going to Singapore. All skins from Zambia are reported to come from ranching operations.

**Zimbabwe:** In 2007, the Crocodile Farmers Association of Zimbabwe (CFAZ) reported exports of 64,490 skins compared to 54,810 skins reported by the Management Authority in Zimbabwe's annual report. However, a comparison with importers data suggested that several shipments had not been included in Zimbabwe's annual report. In 2008, CFAZ reported exports of 81,554 skins compared with 59,509 reported by the Management Authority in the annual report. Data from importing countries suggest that the CFAZ data are a more realistic estimate of exports and these figures have been used in estimating exports wherever possible (Table 3). For 2009, the CFAZ report shows exports of 67,350 skins while the CITES annual report shows only 939 skins. It is known that not all skins exported from Zimbabwe are produced by CFAZ members and therefore these data do not reflect a complete record of Zimbabwe's skin exports.

## 2. Other exporting countries

**Brazil:** No exports have been recorded from Brazil since 44 skins were exported to the United States in 2004.

**Israel:** Israel reported exporting 699 skins to France in 2002, a figure confirmed by the importer. No further trade was reported for 2003–2008, but Germany reported the import of two skins in 2009.

**Mauritius:** Mauritius first reported exporting skins (30) from captive-bred individuals in 2000. This gradually increased to 400 in 2004, but decreased to 150 in 2005. In 2006, Mauritius reported exporting 184 skins and, in 2007, a further 231. No information has been received from Mauritius for 2008 and no Parties have reported importing skins from there in 2008. In 2009 Mauritius reported exporting 100 skins to Zimbabwe. Previous importers have also included Madagascar and Singapore.

### *Crocodylus novaeguineae* New Guinea crocodile

Over the ten-year period 2000 to 2009, the total number of skins of this species exported by the main producers, Indonesia and Papua New Guinea, peaked in 2004 and 2006, but then decreased again each year since (Table 4). The recent decrease, however, only reflects the trade in skins from Indonesia; trade from Papua New Guinea showed a slight increase between 2007 and 2009.

**Table 4. Reported trade in *Crocodylus novaeguineae* skins, 2000-2009**

Country	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Indonesia	7,215	9,946	11,951	8,826	10,481	13,585	16,575	12,759	10,588	7,255
PNG	16,018	20,688	18,798	18,482	29,315	18,417	22,070	15,904	*16,955	*18,840
<b>Total</b>	<b>23,233</b>	<b>30,634</b>	<b>30,749</b>	<b>27,308</b>	<b>39,796</b>	<b>32,002</b>	<b>38,645</b>	<b>28,663</b>	<b>27,543</b>	<b>26,095</b>

Key: \* pers. comm. with Papua New Guinea Management Authority

**Indonesia:** Exports fluctuated between 2000 and 2009 from a low of 7,215 in 2000 to a peak of 16,575 in 2006. Exports decreased steadily since 2006, falling to levels similar to 2000 in 2009. The main destinations for *C. novaeguineae* skins were Japan, the Republic of Korea and Singapore. The proportion of skins reported as wild collected increased from 28 per cent of the total in 2002 to 82 per cent in 2005, fell to between 60 and 70 per cent between 2006 and 2008 and rose again to 83 per cent in 2009.

**Papua New Guinea:** Exports peaked in 2004 with 29,315 skins, but then decreased to a low of 15,904 skins in 2007. Exports increased slightly in 2008 and 2009 to 18,840. Papua New Guinea has not officially submitted annual reports for 2008 and 2009 to the CITES Secretariat but have provided the author with trade statistics for crocodylians for those years. The majority of the skins were exported to Japan, with smaller quantities being imported by Australia, France and Singapore. In 2000, wild-collected skins accounted for 83 per cent of the production, increasing to 93 per cent in 2001. All skins exported by Papua New Guinea since 2001 have been wild-sourced, with the exception of four skins of animals bred in captivity exported in 2004.

### *Crocodylus porosus* Saltwater crocodile

*Crocodylus porosus* is listed in Appendix I, except for populations of Australia, Indonesia, and Papua New Guinea which are listed in Appendix II. The total number of *C. porosus* skins exported by the main producers—Australia, Indonesia, Malaysia, Papua New Guinea, Singapore and Thailand—steadily increased between 2000 and 2008, rising to a total of 53,918 skins in 2008, but decreasing to 45,997 in 2009 (Table 5).

**Table 5. Reported trade in *Crocodylus porosus* skins, 2000-2009**

Country	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Australia	13,296	11,849	*10,423	*14,744	*12,741	*20,409	*16,123	*21,314	28,626	*26,990
Indonesia	3,172	3,456	3,277	2,732	3,968	4,714	3,825	5,151	5,718	4,996

<b>Total</b>	<b>25,791</b>	<b>28,223</b>	<b>24,278</b>	<b>26,564</b>	<b>30,728</b>	<b>37,441</b>	<b>34,152</b>	<b>45,215</b>	<b>53,918</b>	<b>45,997</b>

Key: \* Figure wholly or partly derived from import data

**Australia:** Comparison of data reported by Australia with that reported by importing countries suggests that Australia may be underreporting the quantities of skins exported. Therefore, the data for the years 2002 to 2007 and 2009 provided in Table 5 have been taken from reports of the importing countries less data imported on export permits issued the previous year. Data reported by Australia for 2008 appear to be more accurate so have been included. Reported exports from Australia increased in 2008 to 28,626 and then decreased slightly to 26,990 (according to importer-reported data). Seventy per cent of the exports in 2005 and 2006 were reported to be from captive-bred individuals, with the remainder coming from ranching operations. In the three subsequent years, the amount of skins reported as ranched increased to around 43 per cent. The destinations of the skins were mainly France, Italy, Japan and Singapore, with smaller quantities going to Indonesia, the Republic of Korea and the United States.

**Indonesia:** Indonesia's exports showed a relatively steady increase between 2000 and 2008, rising to 5,718 skins, but exports fell to 4,996 in 2009 (Table 5). The main importers were Japan and Singapore with lesser quantities going to France and Italy. The source of the skins has varied between captive-bred and ranched and appears to have been reported in a very inconsistent manner. In 2007, 42 per cent were from captive breeding, the remainder from ranching, and in 2008, 88 per cent were from captive-breeding, with the remainder from ranching. In 2009, 54 per cent were from captive-breeding - it therefore seems possible that these sources are being used interchangeably.

**Malaysia:** Data from Malaysia come from at least two separate Management Authorities and appear to be poorly correlated. In addition, Singapore, almost the sole importer of crocodylian skins from Malaysia, did not distinguish between belly skins and back straps in earlier years so it is possible that quantities have been overestimated. The number of skins reported as imports by Singapore are provided in Table 5 rather than the inconsistent data from Malaysia. On the basis of this data, imports have decreased between 2006 and 2009 from 1,684 to 587 skins. There are five CITES-registered captive-breeding operations for this species in Malaysia.

**Papua New Guinea:** Papua New Guinea's exports peaked in 2008 with exports of 14,074 and subsequently decreased to 11,910 in 2009 (Table 5). The increased export in 2008 was the result of reduction of breeding stock on the farms (E. Langelet, *pers comm.*). The proportion of skins from captive-bred animals was reported to be 61 per cent in 2005, increasing steadily to 73 per cent in 2009.

**Singapore:** Singapore reported commercial exports of 1,683 skins in 2007 and 1,877 in 2008 (Table 5), apparently from registered captive-breeding operations (of which there are two). Most of the skins went to France and Italy, with a small number going to Japan. No exports were reported in 2009 and no countries reported any imports from Singapore.

**Thailand:** Thailand's reported exports of skins decreased steadily between 2007 and 2009, with 3,149 exported in 2007, 2,560 in 2008 and 1,229 in 2009, all from animals bred in captivity (Table 5). There are 12 CITES-registered captive-breeding operations for this species in Thailand, and recent figures suggest an increase in production from these facilities.

### *Crocodylus rhombifer* Cuban crocodile

No trade has been reported for this Appendix-I species since 1998, apart from one skin reported as a personal import by Denmark in 2004.

### *Crocodylus siamensis* Siamese crocodile

**Cambodia:** Singapore reported importing 30 skins from Cambodia in 2001, the first reported trade involving that country. No further direct trade in skins from that country was reported until 2007 when Cambodia reported exporting 100 skins to Thailand from a registered captive breeding operation. In 2008, Cambodia reported exporting a further 1,300 skins to Thailand. Cambodia's 2009 annual report has not yet been received, but no trade has been recorded by importers for that year. Cambodia has six crocodile farms registered with the CITES Secretariat for the commercial production of this species.

**Thailand:** There are 22 crocodile farms registered with the CITES Secretariat for commercial production of this species in Thailand. Reported exports were less than 6,000 skins annually between 1995 and 2002, but then increased steadily from 10,982 in 2003 to 39,109 in 2008. In 2009, however, the quantity exported decreased to 24,890 skins (Figure 4). The main importer is Japan, with smaller quantities going to Italy and Singapore.

**Viet Nam:** The first reported exports were of 825 skins in 2004, with a further 3,371 skins being exported in 2005. . Since then, exports have steadily increased with 16,125 skins exported in 2006; 17,190 in 2007 and 23,062 in 2008; however, exports decreased to 9,483 in 2009 (Figure 4). Japan, Singapore, the Republic of Korea, France and Italy were the main destinations for the skins. Viet Nam has seven captive-breeding operations registered with the CITES Secretariat for this species.

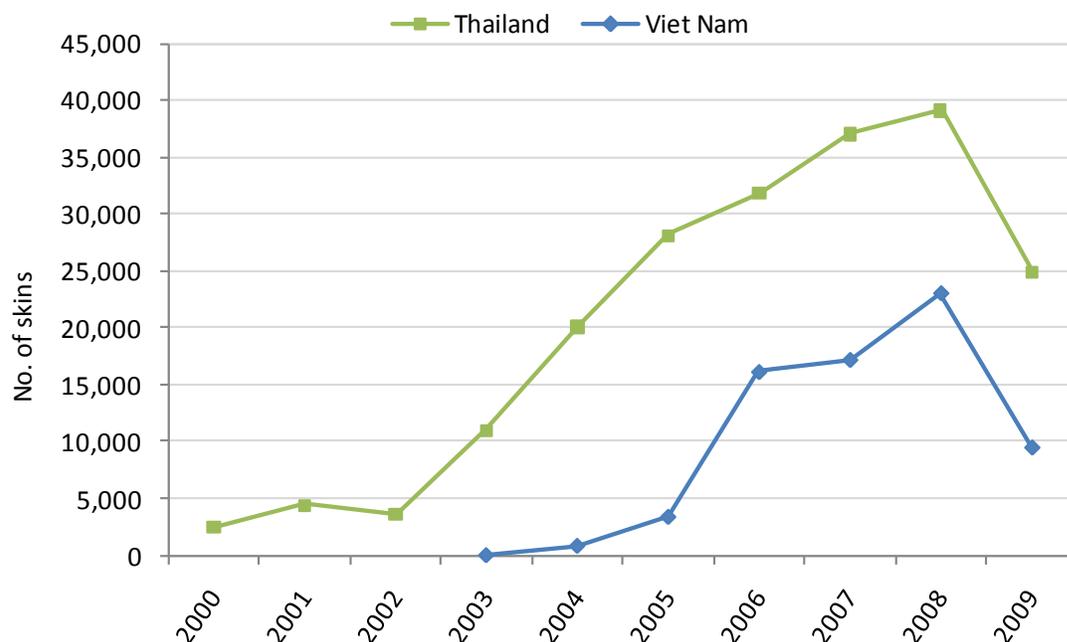

Figure 4. Exports of *Crocodylus siamensis* skins from Thailand and Viet Nam 2000–2009

### *Crocodylus siamensis/porosus* Crocodile hybrid

No international trade in skins of this hybrid species has been reported since 1995.

### *Osteolaemus tetraspis* West African dwarf crocodile

There is no international trade in skins of this Appendix-I species.

### *Alligator mississippiensis* American alligator

In the 21 years between 1986 and 2006, reported exports of *A. mississippiensis* from the United States increased from around 31,000 skins in 1986 to 421,220 in 2006. However, exports declined sharply (by 38 per cent) in 2007, and fell further in 2008, to pre-2003 levels (Table 6; Figure 5). The source of this dramatic change is unclear, but it may have been the result of a combination of factors including over supply of both caiman and alligator skins in 2006, the effect of two hurricanes on alligator habitat, and the general global financial downturn which may have reduced the demand for luxury leather goods. In 2009, exports increased by almost 30 per cent to 297,187 skins.

Table 6. Exports of *Alligator mississippiensis* skins reported by USA 1986-2009

1986	1987	1988	1989	1990	1991	1992	1993	1994	1995	1996	1997
31,235	45,177	50,303	76,963	120,419	128,447	155,264	192,286	210,236	185,929	163,936	168,649
1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
206,620	239,519	248,922	343,110	237,840	341,734	368,409	356,393	421,220	262,133	230,464	297,187

Four countries, France, Germany, Italy and Singapore, import 95 per cent of production, with smaller quantities being imported by Mexico and Panama.

It has been noted in recent IACTS reports that the compilers of the CITES annual report of the United States were probably using the code 'C' (bred in captivity) for ranched animals rather than the code 'R' up until 2004. In 2004, for instance, 58 per cent of exports were reported as coming from captive-bred individuals. However, in 2005, there appears to have been a change of policy and 99.5 per cent of the skins for that and subsequent years were reported as coming from wild-caught individuals (purpose code 'W'). This is presumably a result of the decision by the CITES Management Authority that the code 'R' should only be used in the case of crocodilian populations transferred from Appendix I to Appendix II subject to ranching. Other codes used are 'F' – animals born in captivity (F1 or subsequent generations that do not fulfil the definition of 'bred in captivity' in Resolution Conf. 10.16 (Rev.).

This species is also bred in captivity in Israel, but none have been exported from Israel since 2001.

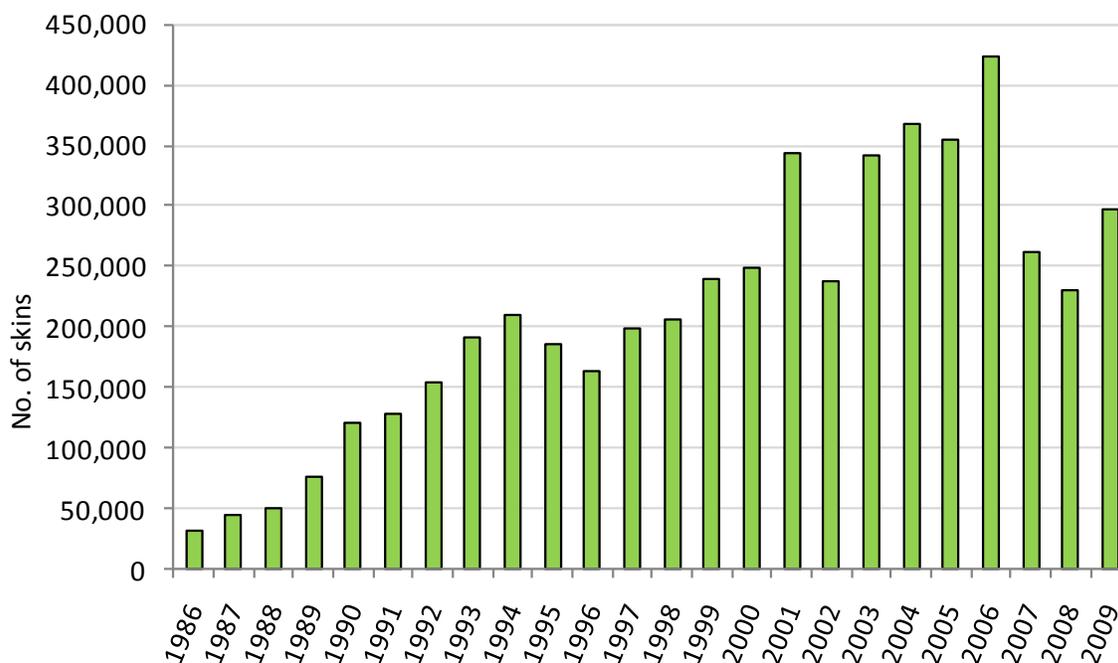

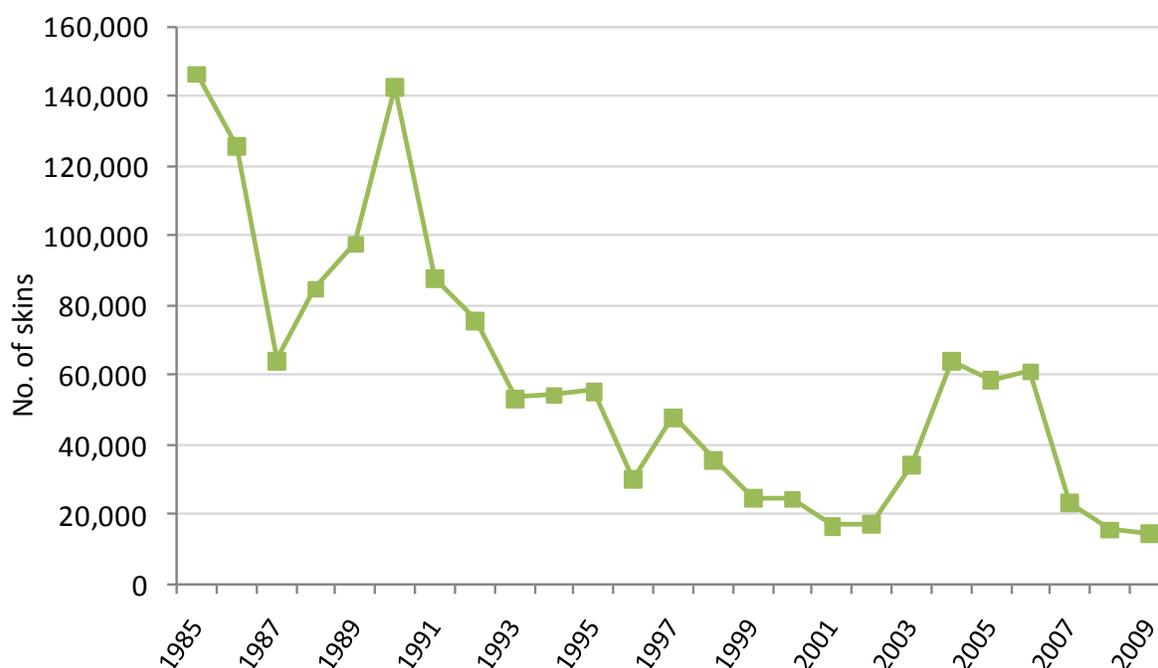

Figure 5. Exports of *A. mississippiensis* skins from the United States, 1985-2009

### *Caiman crocodilus crocodilus* Spectacled caiman

The **Bolivarian Republic of Venezuela** (hereafter referred to as Venezuela) is the main supplier of skins of this species, almost all from wild-collected animals. Historic levels have been recorded in previous IACTS reports and the quantity of skins exported annually from Venezuela since 1985 is shown in Figure 6. Between 2004 and 2006, Venezuela exported around 60,000 skins annually; however, exports plunged to less than half that level in 2007 and fell further in 2008 to 17,000. The Venezuela report for 2009 shows a total of 10,298 skins and 5,340 chalecos exported in 2009 – a further decline.

**Figure 6. Exports of *Caiman crocodilus crocodilus* skins from Venezuela 1985-2009**

While **Guyana** was previously a major supplier of this species in the late 1980s (with over 350,000 skins exported), exports dwindled during the 1990s. Exports during the first half of the 2000s were also relatively low in comparison, but trade has increased in recent years. In 2007, Guyana reported exporting a total of 16,707 skins, the majority going to Mexico, but with smaller quantities going to Panama, Republic of Korea and Thailand. In 2008, reported exports came to 21,000 skins and, although no report has been received from Guyana for 2009, imports reported by Mexico suggest at least 28,000 wild-caught skins were traded in that year.

**Colombia** also farms small numbers of *Caiman crocodilus crocodilus* and exports amounted to 4,986 in 2007 and 3,000 in 2008; all were reported to be from animals bred in captivity. No further exports were reported in 2009.

### ***Caiman crocodilus fuscus* Brown caiman**

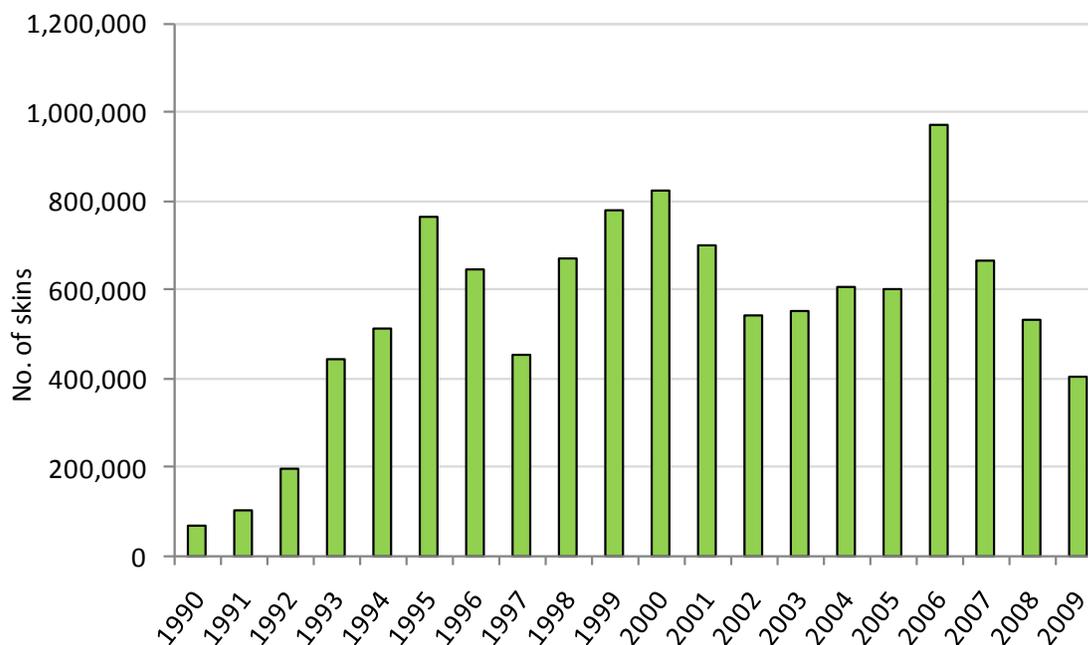

As with *C. crocodilus crocodilus*, the history of the trade in skins of *C. crocodilus fuscus* has been well documented in recent IACTS reports. Details of the countries reportedly exporting this species from 2000 to 2009 are provided in Table 7.

**Table 7. Reported trade in *Caiman crocodilus fuscus* skins, 2000-2009**

Exporter	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Colombia	824,303	698,413	540,579	552,219	605,841	599,527	970,731	668,076	532,394	405,386
Nicaragua	6,440	0	0	0	0	0	0	0	0	0
Panama	10,250	11,700	11,498	19,840	15,850	*3,696	*2,310	*2,752	*1,155	*995
<b>Total</b>	<b>840,993</b>	<b>710,113</b>	<b>552,077</b>	<b>572,059</b>	<b>621,691</b>	<b>603,223</b>	<b>972,941</b>	<b>670,828</b>	<b>533,549</b>	<b>406,381</b>

Key: \* Figure derived from import data.

**Colombia** remains the major exporter of this species and reported exports from that country between 1990 and 2009 are provided in Figure 7. Exports have decreased steadily since 2006 from 970,731 to 405,386 skins in 2009, the smallest quantity exported since 1992. The proportion of Colombia's skin production exported to Singapore has fluctuated between 47 and 56 per cent between 2003 and 2009 and most of the skins were then re-exported. The other major importers are the United States and Mexico who imported 12 and 18 per cent respectively between 2004 and 2009. The percentage of skins directly exported to Thailand decreased steadily from 30 per cent in 1997 to around 6 per cent between 2004 and 2009.

**Figure 7. Exports of *Caiman crocodilus fuscus* skins from Colombia, 1990-2009**

No exports have been reported by Honduras since 1998 or by Nicaragua since 2000. Although an important entrepôt State, Panama clearly distinguishes between exports and re-exports in its annual reports. The first significant direct export of 10,250 skins was reported in 2000 and trade appears to have peaked in 2003 at 19,840. Panama's annual reports for 2005 to 2008 do not appear to be complete, and their report for 2009 has not been received, so the quantities for the most recent years in Table 7 have been taken from the reports of the importing countries, particularly Italy, Mexico, Singapore and Spain.

### ***Caiman latirostris* Broad-snouted caiman**

The Argentine population of this species was transferred from CITES Appendix I to Appendix II in 1997, and the first skins from ranched animals were reported by Argentina in 2001, a shipment of 88 to Italy. Exports increased subsequently from 2002-2005, reaching a level of 2,752 skins in 2005, with most of the skins going to Mexico (56 per cent) and Italy (36 per cent). Exports then fell to 1,652 in 2006, to 1,125 in 2007, to 987 in 2008 and to 394 in 2009. All skins were reportedly from ranched animals.

## *Caiman yacare* Yacaré

Exports of *C. yacare* skins from the major producing countries fluctuated over the period between 2000 and 2009, but exports from Bolivia appear to have decreased notably by 46 per cent in 2009 (Table 8).

**Table 8. Reported trade in *Caiman yacare* skins, 2000 -2009**

Exporter	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Argentina	0	0	0	0	1	1,291	2,883	6,083	3,851	10,194
Bolivia	*4,116	28,170	63,725	43,028	34,878	51,330	44,443	49,115	*51,618	*27,900
Brazil	1,763	978	6,048	12,851	7,004	*620	*3,173	*10,254	5,828	9,064
Paraguay	9,750	2,980	9,038	4,409	0	0	0	0	0	0
<b>Total</b>	<b>15,629</b>	<b>32,128</b>	<b>78,811</b>	<b>60,288</b>	<b>41,882</b>	<b>53,241</b>	<b>50,499</b>	<b>65,452</b>	<b>61,297</b>	<b>47,158</b>

Key: \* Figure derived from import data

**Argentina:** Reported exports increased steadily between 2004 and 2009, peaking at 10,194 skins in 2009. The main destination for the skins was the United States. All of the skins were reported to be from ranching operations.

**Bolivia:** Reported exports increased from 34,878 to 51,618 between 2004 and 2008 and then reportedly fell by 46 per cent to 27,900 in 2009 (according to importer-reported data). Data from both 2008 and 2009 come from the importers and may be inflated artificially by skins exported in previous years.

**Brazil:** Reports from Brazil for 2005 to 2007 do not distinguish adequately between whole skins, skin pieces and manufactured items. Data for these years have therefore been taken from the reports of the importing countries, principally Mexico and the United States (Table 8). In 2008, Brazil reported exporting 5,828 skins and a further 9,064 in 2009. All skins were from captive-breeding operations.

**Paraguay:** Regular exports of wild-collected skins occurred between 1994 and 2003. Paraguay reported exports of 9,038 in 2002 and 4,409 in 2003, but then imposed a moratorium on all exports of wildlife in September 2003 as a result of the findings of a technical mission from the CITES Secretariat. No reported exports of skins have been recorded in trade since.

### *Melanosuchus niger* Black caiman

The Brazilian population of this species was transferred from CITES Appendix I to Appendix II in 2007. In 2008, France reported importing eight skins from Brazil with source 'W' and a further two skins, also of wild origin, were reported as an import by Germany in 2009.

### Other Species

There have been no reported commercial exports from origin countries between 2000 and 2008

of skins of the following species: *Crocodylus cataphractus*, *C. intermedius*, *C. palustris*, *Alligator sinensis*, *Palaeosuchus palpebrosus*, *P. trigonatus*, *Gavialis gangeticus* or *Tomistoma schlegelii*.

## Trade in Live Animals

The commercial export of live crocodylians outside of their range States poses a potential threat to the natural biological diversity of the importing countries. The effect that these alien animals may have on native populations of crocodylians is inestimable should they establish breeding populations, a serious possibility given suitable environmental conditions and habitat. Previous IACTS reports have noted that the continued growth of the crocodylian farming industry would mean that such exports would continue for the time being.

Live crocodylians are traded for many reasons. Young animals are frequently kept as personal pets; circuses and zoos regularly exhibit such creatures and there are well-established crocodile breeding establishments in Denmark, France, Morocco and Spain. In range States, crocodile farms and ranches import animals to supplement their gene pool and some animals are imported in order to strengthen wild populations. This variety of use, and the limited number of possible purpose codes used in CITES annual reports, means that some conclusions drawn from analysis of CITES data are only tentative. For example, the purpose code 'T' which indicates a commercial transaction would apply equally if the animals were destined for either the pet trade or the farming industry. Below we consider the reported trade in live animals on a species by species basis.

### *Alligator mississippiensis*

There have been limited exports from the United States, mostly destined for circuses and zoos. In 2007 and 2008, the entire trade in live *A. mississippiensis* amounted to only six animals. However, in 2009, Denmark reported importing 30 wild-sourced specimens from the United States for scientific purposes.

### *Alligator sinensis*

In 2007, China reported exporting 25 animals to Spain. Then, in 2008, China exported 20 to Denmark, 27 to France and 34 to Japan. In 2009, a further 26 were exported to Denmark, 30 to Spain and 10 to Japan. All animals were captive-bred specimens.

### *Caiman crocodilus*

**Guyana** reported exporting 1,612 animals in 2007; subsequently, reported exports increased substantially in 2008 to 7,742 animals, with over 5,000 reportedly going to China. This trade was not reported by China. No report has been received from Guyana for 2009 and reported imports by Mexico and Netherlands amount to 1,150. All were wild caught and presumably destined for the pet industry.

**Suriname** regularly exports small numbers of wild-caught animals for the pet industry,

although there was no reported trade in live caimans in 2005. Between 2006 and 2009, Suriname reported exporting a total of 252 animals.

**Venezuela** reported exporting 4,650 *Caiman crocodilus crocodilus* in 2006 and 4,500 in 2007. All were reported to be of ranched stock or captive-bred. There were no reports of live trade involving Venezuela in either 2008 or 2009.

#### *Caiman yacare*

In 2006, Denmark reported importing eight ranched animals from Argentina, but none have been reported in trade from range States subsequently.

#### *Melanosuchus niger*

Ecuador reported exporting 52 captive-bred specimens to Denmark in 2007, but Denmark only reported importing 26. It would seem likely that the latter was the true figure and that Ecuador may have re-issued the permit. Denmark reported importing a further two animals, apparently ranched, from Ecuador in 2009.

#### *Palaeosuchus palpebrosus*

Guyana has an export quota of 500 live wild specimens annually and reported exporting 423 in 2007 and 586 in 2008. Importers' data suggest the figure was about 467 specimens in 2009. The animals all appear to be for the pet industry with the main importing country being the United States. Smaller quantities were exported to Canada, Europe, Japan and the Russian Federation.

#### *Palaeosuchus trigonatus*

Similar to *P. palpebrosus*, Guyana has an export quota of 1,000 live wild specimens annually and reported exports of 575 in 2007 and 745 in 2008. Importers' data suggest the figure was only 352 in 2009. As with the previous species, the main importing country was the United States, with smaller quantities going to Canada, Europe, Japan, the Russian Federation and Thailand.

#### *Crocodylus acutus*

In 2006, Kuwait reported importing three captive-bred animals from Egypt and a further three from the Russian Federation for circus purposes, their source being listed as 'F'. El Salvador reported seizing three from an unknown country of export in 2009.

#### *Crocodylus mindorensis*

In 2006, Denmark reported importing 15 animals from the Philippines for breeding purposes, their source being listed as 'F', and the Czech Republic reported importing 10 captive-bred specimens from the Philippines in 2009 for a zoo.

#### *Crocodylus moreletii*

Mexico reported exporting 30 animals to Morocco in 2005. No further trade in live animals was

reported until 2009 when Mexico exported 23 to Japan and Spain reported the seizure of three, also from Mexico.

### *Crocodylus niloticus*

South Africa is the main importer of live specimens of this species, importing from the neighbouring range States of Botswana (until 2002), Kenya (in 2003) and Namibia (up to 2004) but mostly from Mozambique. Mozambique has been exporting hatchlings and juveniles to South Africa since the late 1980s. In recent years, Mozambique's reported exports increased from of 5,600 in 2003 to 25,000 in 2004 and 24,200 in 2005. Quantities then increased further in 2006 to 49,000 (29,000 animals to South Africa and 20,000 to Zimbabwe); 66,200 in 2007 (31,200 to South Africa and 35,000 to Zimbabwe); and 91,000 in 2008 (61,000 to South Africa and 30,000 to Zimbabwe). In 2009, however, Mozambique's reported exports decreased by 59 per cent to 37,160 (17,160 animals to South Africa and 20,000 to Zimbabwe). The Mozambique 2010 report shows no live exports to South Africa but 15,000 to Zimbabwe.

### *Crocodylus palustris*

India reported exporting 40 captive-bred animals to Bangladesh in 2005 for zoo purposes; the transaction was also reported by the importer. No further trade in this species has been reported subsequently.

### *Crocodylus porosus*

Thailand reported exporting one live animal to Germany, 19 to Japan and two to Viet Nam in 2007, and 15 to France and 10 to South Africa in 2008. The United States reported importing one from Australia in 2009.

### *Crocodylus siamensis*

China began importing this species from Thailand in 1997, from Cambodia in 2000 and from Viet Nam in 2003. As shown in Table 9, China has imported over 450,000 live specimens from these countries in the ten-year period 2000 to 2009. Thailand has also exported over 11,000 live animals to Cambodia, Egypt, Hong Kong, Japan, Malaysia, Philippines, the Republic of Korea, South Africa, Taiwan, Province of China, and Viet Nam since 2005. As noted in the section on skins, Cambodia has six crocodile farms, Thailand has 22 and Viet Nam has seven farms registered with the CITES Secretariat for the commercial production of this species.

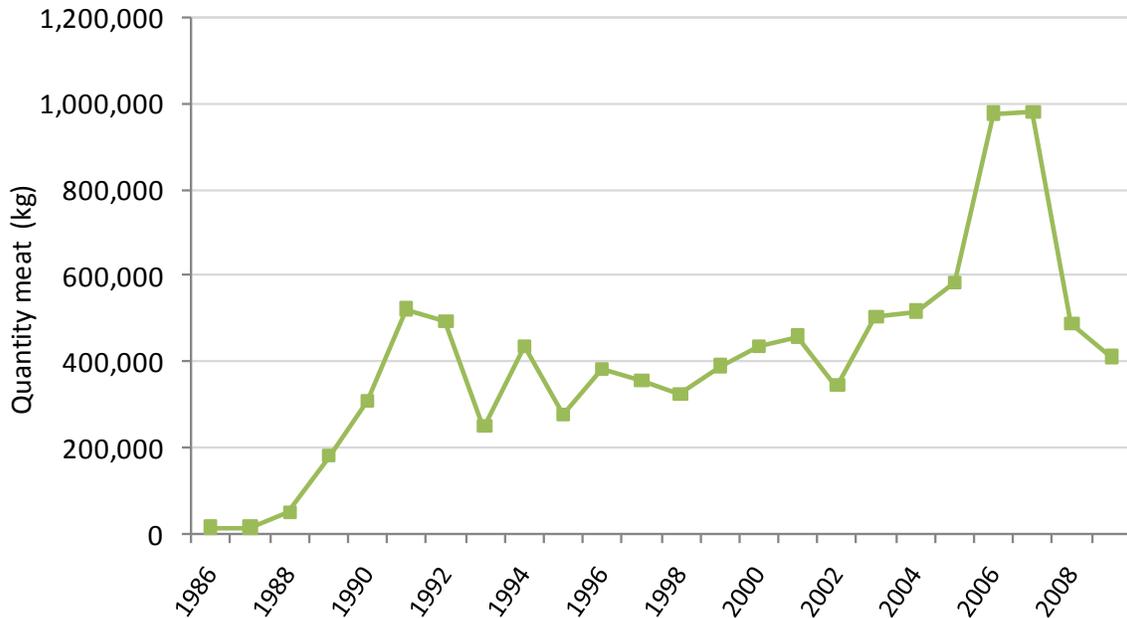

**Table 9. China's import trade in live *Crocodylus siamensis* 1999-2008**

Exporter	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Cambodia	13,000	16,572	34,809	640	5,000	0	0	0	1,500	1,600
Thailand	26,475	13,179	10,898	17,300	30,250	23,696	58,793	47,180	23,600	16,600
Viet Nam	0	0	0	7,700	3,200	9,300	13,000	24,050	41,400	11,137
<b>Total</b>	<b>39,475</b>	<b>29,751</b>	<b>45,977</b>	<b>25,640</b>	<b>38,450</b>	<b>32,996</b>	<b>71,793</b>	<b>71,230</b>	<b>66,500</b>	<b>29,337</b>

### Trade in other by-products

#### a. Meat

Total world exports in crocodylian meat, as reported in CITES annual reports from 1986 to 2009, is provided in Figure 8. Between 1990 and 2005, the amount traded globally fluctuated at around 400 tonnes yearly. However, exports increased sharply in 2006 and amounted to over 900 t in both that year and in 2007. In 2008, the quantity of meat exported decreased to just under 500 t, and fell further in 2009 to approximately 400 t, with no meat from caiman being reported in trade for either of those two years.

**Figure 8. Global exports of crocodylian meat, 1986–2009**

Since 1988, there have been major fluctuations in the countries and species involved. Until 1992, the main species in trade was *Alligator mississippiensis* from the United States, particularly to Taiwan, Province of China, Japan, Canada and the United Kingdom. No exports to Taiwan, Province of China, have been reported since 1994 and export levels have fallen since 1995 with the main importers currently being Canada and Hong Kong.

Exports of meat from *Crocodylus niloticus*, particularly from South Africa and Zimbabwe, have increased steadily from less than two tonnes in 1992 to over 475 t in 2007, but then decreased to

a quarter of that value over the following two years. The main destinations for the African crocodile meat are Europe, Hong Kong and China. It appears that all of Zambia's production was exported via South Africa up to 2005; however, in 2006, Zambia began exporting directly to Europe and Hong Kong. Imports from Israel and the United Republic of Tanzania have not been reported since 1996.

Exports of meat from Indonesia of both *Crocodylus novaeguineae* and *C. porosus* increased up to 2000; however, since then exports dwindled to just over 600 kg in each of 2001, 2002 and 2003, none in 2004, and around 1,500 kg in each of 2005, 2006 and 2007. In 2008, 800 kg were exported but this increased to 3,500 kg in 2009 and all was reported to be *C. porosus*. Most of the exports were destined for Hong Kong and Malaysia.

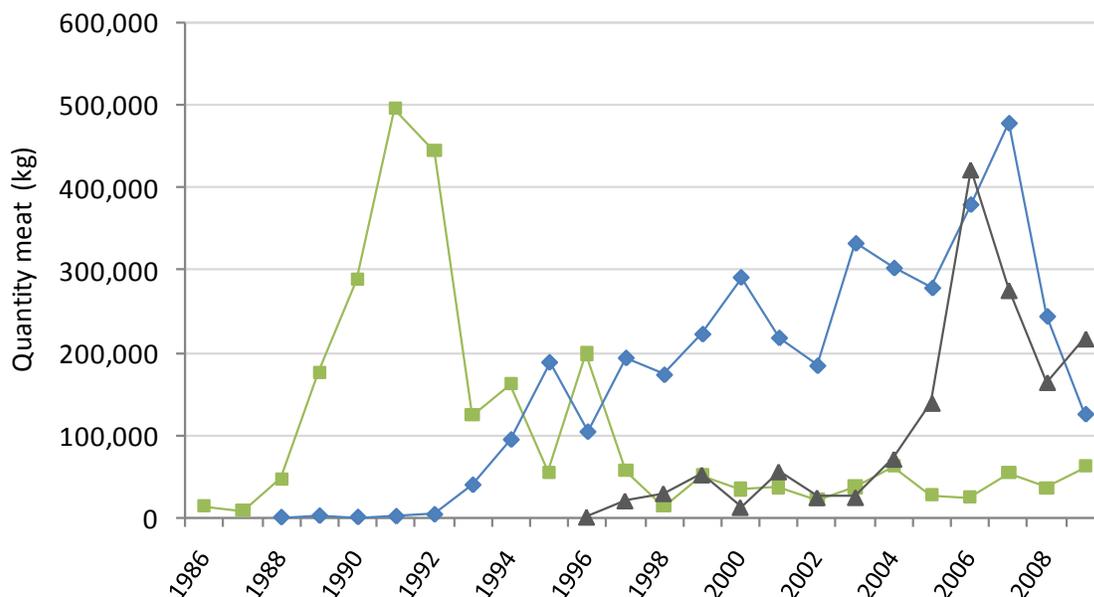

Australia's exports of *Crocodylus porosus* increased from 53 t in 2000 to 57 t in both 2001 and 2002, but then fell to below 20 t annually between 2004 and 2009. Although it is possible that the quantities in recent Australian annual reports are underestimated, the decrease may indicate that crocodile meat is becoming more popular for local consumption. Apart from occasional exports to Europe and New Zealand, the main destinations for Australia's production were China, Japan, Malaysia, Hong Kong and Taiwan, Province of China.

Singapore exported small quantities of crocodile meat, usually less than one tonne, annually to Hong Kong up to 2005, but none has been reported since then.

Exports of meat from Papua New Guinea used to be composed of mixed shipments of both *Crocodylus novaeguineae* and *C. porosus* and averaged almost 60 t annually between 1996 and 2003. All exports reported by Papua New Guinea since then have been of *C. porosus*, although Australia reported importing meat of *C. novaeguineae* in both 2003 and 2005. The volume exported was reported to be 45 t in each of 2004, 2005 and 2006, but decreased to just over 30 t in 2007. In 2008, the Australian annual report showed imports of 30 t of *C. porosus* meat originating in Papua New Guinea but the exporting country was not specified. It seems likely that these were in fact direct imports from Papua New Guinea. No meat from Papua New Guinea has been reported in 2009.

The biggest change in the crocodylian meat trade in recent years has been the expansion of the trade in *Crocodylus siamensis*. Thailand used to be the only exporter of *C. siamensis* meat and exports averaged about 35 t annually between 1999 and 2003. In 2004, exports increased to over 68 t, to almost 140 t in 2005 and to almost 400 t in 2006. In 2007, however, reported exports fell to 273 t, and again to 159 t in 2008. In 2009, reported exports rose again to almost 215 t. The Thailand annual report describes the product as both 'meat' and 'meat and bone' and the main importing countries are China, Hong Kong, the Republic of Korea and Taiwan, Province of China. In 2005, Viet Nam reported exporting 100 kg to Switzerland that was confirmed as an import by Switzerland in 2006. Reported exports increased to over 24 t in 2006 with the main destinations being China, Europe and the Republic of Korea. Exports appear to have fallen to

around two tonnes in 2007 and recovered a little to 5.5 t in 2008 but decreased to 3.5 t in 2009. Figure 9 shows the relative importance of the three main species from 1986 to 2009.

**Figure 9. Comparison of exports of meat of *Alligator mississippiensis*, *Crocodylus niloticus*, and *C.siamensis*, 1986-2009.**

There have been small exports by Mexico of meat of *Crocodylus moreletii* amounting to 432 kg in 2000, 3,550 kg in 2002 and 1,000 kg in 2003. No trade in meat of this species has been reported subsequently. Apart from 50 kg reported as an export to Spain in 2002, the sole importer has been Japan.

Exports of meat from South American caiman have fluctuated considerably, with almost no trade being reported between 1998 and 2003, nor in 2008 and 2009. However, in 2004, Colombia exported a small quantity to Macao and in 2005 a similar amount to China. Then, in 2006, they reported exports of 9.5 t to Taiwan, Province of China, followed by 110 t in 2007. Bolivia began with an export of 13 kg to United States in 2003 followed by 22.5 t in 2004. In 2005, the quantity increased to 68.7 t to Europe and the United States, and further to 82 t in 2006. However, in 2007, the volume dropped to 20 t and the destination changed to China. Argentina has reported exporting a few tonnes to the United Kingdom in 2006 and 2007.

### **b. Teeth**

Australia is the world's foremost user of crocodile teeth and between 1999 and 2009 imported nearly 415,000. Most of the teeth were *Crocodylus porosus* from the operations in Malaysia, Papua New Guinea and Singapore, but Australia also imported *C. siamensis* teeth from Thailand and alligator teeth from the United States. Imports were 77,000 in 2003 but fell to 18,500 the following year. Since then, trade has gradually increased and amounted to over 47,000 in 2007. In 2008, the trade fell back to 19,105 from Singapore and Thailand and decreased further to only 5,000 teeth from Singapore in 2009.

## Declared dollar value

Although CITES annual reports do not usually contain information concerning the value of the trade or of individual shipments, the United States has included this information since 1997. This figure is not necessarily accurate, but it is occasionally used by UNEP-WCMC to identify errors in that report; for example, where it is suspected that a decimal point may have been omitted. There is great fluctuation amongst the reported values as may be expected and no indication of the size or quality of the skins is provided; indeed, for caiman species flanks may have been reported as whole skins to further complicate the issue. Values that appear erroneous and are likely to have been the result of typographic errors have been ignored in the analysis below. The average declared value per skin (in US\$) of exports of *Alligator mississippiensis* and the reported value of re-imports of these skins from Europe, Mexico and Asia after tanning are provided in Table 10. Although the original value of exports fluctuates from year to year, the value of the re-imports has been consistently higher, as one would expect.

**Table 10. Reported US dollar value of *Alligator mississippiensis* skins (per skin), 1997-2009**

	1997	1998	1999	2000	2001	2002	2003
Exports by USA	103.7	77.8	97.6	102.9	100.8	101.4	106.4
Re-imports by USA	143.0	116.3	140.0	179.4	169.5	108.6	124.6

	2004	2005	2006	2007	2008	2009
Exports by USA	112.5	142.6	177.9	232.9	242.2	193.3
Re-imports by USA	144.9	168.3	193.5	253.4	254.8	394.7

Table 11 compares the United States reported average value per skin of Colombian *Caiman crocodilus fuscus* imported directly from Colombia and via third countries. The source of re-exported skins varies from year to year, but the majority are imported directly from Colombia or via Singapore. The declared value of the direct imports from Colombia remained at around US\$50 per skin between 2002 and 2008 but appears to have increased notably in 2009 to the highest value over the period 1998-2009.

**Table 11. Reported US dollar value of Colombian *Caiman crocodilus fuscus* skins (per skin), 1998-2009**

(Re-)Exporter	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Colombia	38.6	39.7	37.4	43.5	50.7	49.9	46.8	50.6	50.8	54.4	52.5	72.2
European Community	81.3	25.2	68.5	24.7	63.8	-	-	28.0	34.5	-	-	87.3
Mexico	-	52.4	43.5	49.1	41.5	38.0	-	97.8	31.2	50.0	36.3	38.0
Panama	27.1	-	20.2	59.2	-	54.4	-	-	-	-	-	-
Singapore	48.6	44.7	42.5	43.8	39.9	47.8	43.4	43.1	46.7	46.1	44.3	47.3
Switzerland	-	61.4	28.6	29.5	25.0	-	29.5	33.9	41.3	28.5	-	33.0
Thailand	48.6	49.4	45.8	52.2	56.5	32.6	54.0	53.8	62.0	63.0	-	31.3

## Reported seizures

Information on seizures is supposed to be recorded in CITES annual reports but is usually omitted, perhaps because the relevant authorities involved, i.e. the Customs officers making the seizures and the CITES Management Authorities producing the annual reports seldom liaise closely. Indeed, many countries believe that seizures should only be reported in their biennial report and not the annual report. Furthermore, the data recorded by Customs rarely allow the goods to be identified at the species level. Most of the seizures that are reported are of tourist items such as dried heads, whole stuffed baby crocodiles, etc. and personal imports of manufactured leather goods. It should be noted that most of the data reflect the diligence of Customs officers inspecting tourist luggage and do not indicate problem areas for the crocodylian industry. In addition, many of the items seized on import are subsequently released to the importer when adequate permits have been obtained.

Of the more significant items reported in the last three years, the United States reported seizures of 200 caiman skins from Thailand (origin Colombia) in 2007. They further reported seizing 1,000 skins directly from Colombia and 4,242 via Mexico and Singapore in 2008. In 2009, the United States reported seizures of 178 *Caiman crocodilus crocodilus* skins from Hong Kong (origin Venezuela), 565 *C. yacare* skins from Argentina and 88 *C. yacare* skins from Bolivia.

## Recommendations

The following recommendations made in previous IACTS reports remain valid:

- ◆ Countries should, where possible, adopt the CITES standard permit number that allow for accurate cross matching of shipments. This format identifies both the exporting country and the year of permit issuance (see CITES Resolution Conf. 12.3 (Rev. CoP15) on Permits and certificates).
- ◆ Standardisation of the terminology used to describe parts of crocodylian skins would reduce the danger of double-counting and subsequent overestimation of trade levels. In particular, there is confusion between hornbacks and backskins for Nile crocodile and between whole skins and sides for caiman. There has been considerable improvement in standardisation of terms, but it is still an area that needs improvement.
- ◆ As the source of specimens (e.g. wild, captive-bred, etc.) provides critical information for determining the conservation impact of trade, CITES Parties should strive to accurately report the source of crocodylian material as defined in the *Guidelines for the preparation and submission of CITES annual reports*.
- ◆ Countries with large-scale farming operations should establish strict monitoring and management programmes for their wild crocodylian populations, and any farming of non-native species should be strictly regulated to ensure there are no escapes into the wild.

Although breeding in captivity can alleviate pressure on wild populations, it can also remove the incentive to preserve them.

- ◆ It is recommended that the CITES Secretariat and the Chairman of the Standing Committee should contact Parties in June of each year to remind them of their reporting obligations under Article VIII, paragraphs 6 and 7.
- ◆ UNEP-WCMC would recommend that wherever possible, Parties report the actual quantities of skins being traded.
