

# **LOUISIANA'S ALLIGATOR MANAGEMENT PROGRAM 2016-2017 ANNUAL REPORT**

presented to  
**THE HOUSE COMMITTEE ON NATURAL  
RESOURCES AND ENVIRONMENT AND THE  
SENATE COMMITTEE ON NATURAL RESOURCES**  
Prepared by  
**Louisiana Department of Wildlife and Fisheries,  
Office of Wildlife, Coastal and Nongame Resources Division  
December 2017**

## Introduction

The Louisiana Department of Wildlife and Fisheries (Department) manages the American Alligator (*Alligator mississippiensis*) as a commercial, renewable natural resource. The Department's sustained use program is one of the world's most recognizable examples of a wildlife conservation success story. Louisiana's program has been used as a model for managing various crocodilian species throughout the world. Since the inception of the Department's program in 1972, over 1,000,000 wild alligators have been harvested, over 9.5 million alligator eggs have been collected, and over 6 million farm raised alligators have been sold bringing in millions of dollars of revenue to landowners, trappers and farmers. Conservative estimates have valued these resources at over 100 million dollars annually, providing significant, direct economic benefit to Louisiana.

This report, per R.S. 56:279 (E), provides a historical perspective, outlines the basis and philosophy of the Department's management program, reviews the federal government's oversight and approval role for management of the alligator in the United States, discusses wild, farm and nuisance alligator programs, lists research activities, and reviews the revenue and expenditure information associated with the management program and the Louisiana Alligator Resource Fund. A separate report, furnished by the Department, details the activities and expenditures of the Alligator Advisory Council.

## Historical Perspective

Alligators have been used commercially for their valuable leather since the 1800s. This harvest was generally unregulated throughout the 1900s, until a gradual population decline resulted in severely reduced harvests in the early 1950s. In 1962, the alligator season in Louisiana was closed, and research studies focusing on basic life history factors were undertaken which led to development of a biologically sound management program. Of tremendous importance was the establishment of a rigorous survey method to estimate and monitor population trends.

From 1962 through August 1972, alligators were totally protected. During this time a myriad of state and federal laws regulating harvest distribution and allocation of take, methods of harvest and possession, transportation and export of live alligators, alligator skins and their products was enacted. Similarly, in 1970 the Louisiana Legislature recognized that the alligator's value, age at sexual maturity, and vulnerability to hunting required unique

consideration and passed legislation providing for a closely regulated experimental commercial harvest.

The goals of the Department's alligator program are to manage and conserve Louisiana's alligators as part of the state's wetland ecosystem, provide benefits to the species, its habitat and the other species of fish and wildlife associated with alligators. The basic philosophy was to develop a sustained use management program which, through regulated harvest, would provide long term benefits to the survival of the species, maintain its habitats, and provide significant economic benefits to the citizens of the state. Since Louisiana's coastal alligator habitats are primarily privately owned (approximately 81%), our sustained use management program provides direct economic benefit and incentive to private landowners, and alligator hunters who lease land, to protect the alligator and to protect, maintain, and enhance the alligator's wetland habitats. One of the most critical components of the management program was to develop the complex set of regulations which required individual applications for each property to be considered for tag allocation, landowner permission, proof of ownership and detailed review of habitat quality related to alligator abundance, all of which combined to equitably distribute the harvest in relation to population levels.

During the period of total protection (1962-1971) alligator populations increased quickly and by 1972 the Department was ready to initiate its new sustained use management program. On September 5, 1972 the alligator season was reopened in Cameron Parish and a total of 59 hunters harvested 1,350 alligators. The season was expanded to include Vermilion Parish in 1973, Calcasieu Parish in 1975, an additional nine coastal parishes in 1979 and statewide in 1981 (Table 1).

## **Oversight by the U.S. Fish and Wildlife Service**

Five years after Louisiana closed the alligator harvest season, the alligator was listed under the federal Endangered Species Act in 1967. At this time the alligator was considered an endangered species throughout its range. In March of 1974, Louisiana petitioned the Secretary of the Interior, requesting that populations of the alligator in Louisiana be removed from the list of threatened and endangered species in Cameron, Vermilion and Calcasieu Parishes. In subsequent years, similar petitions sought to reclassify the alligator, first in nine additional coastal parishes in 1978 and then statewide in 1981. Each of these petitions was based on results of detailed scientific study and the demonstrated success of the early harvest programs.

Export of alligator skins and products out of the United States is regulated by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). This treaty, which became effective in 1975, regulates the international trade in protected species; its aim is to ensure that international trade in specimens of wild animals and plants does not threaten their survival. The U.S. Fish and Wildlife Service (USFWS) administers CITES requirements and controls for the United States. The species covered by CITES are listed on one of three Appendices, according to the degree of protection needed. Currently, the alligator is listed on Appendix II of CITES, because of their similarity of appearance to other crocodilians that are truly endangered or threatened.

In order to fulfill CITES requirements, the USFWS through a series of rulemakings, has developed a complex set of requirements with which the individual states, including Louisiana, must comply in order to be granted export approval for harvested alligators skins and products. The most critical component in these requirements is that the Department must certify, on an annual basis, that the harvest programs we administer will not be detrimental to the survival of the species. The “no detriment” finding is predicated on our assessment of the current condition of the alligator population, including trends, population estimates or indices, data on total harvest, harvest distribution and habitat suitability evaluation. Additionally, the management program must provide for a rigorously controlled harvest with calculated harvest level objectives. All alligators and eggs harvested must be taken from specifically identified properties and all hides individually tagged (with approved, serially marked CITES export tags furnished by the USFWS). The USFWS requires strict accountability for each tag allocated to the harvester, requiring all unused tags be returned at the close of the season.

## Wild Alligator Management Program

In 1970, the Louisiana State Legislature (Act 550) gave the Department of Wildlife and Fisheries full authority to regulate the alligator season in Louisiana. Since that time, the Department has annually inventoried alligator nest production throughout coastal Louisiana in order to assess the status of alligator populations. Results of annual alligator nest surveys are compiled to provide estimates of nest density (acres per nest) by parish and by habitat type (brackish, intermediate, or fresh marshes). Private and publicly owned lands (State and Federal Refuges, and Wildlife Management Areas) are compiled separately.

In June/July 2016, over 2,800 miles of transects were flown, surveying 135,000 acres of wetland habitat. The sampling intensity covers approximately 3.4% of 2.3 million acres of private coastal wetlands, and 3.4-10.8% of some 622,000 acres of public coastal wetlands. During the summer of 2016 we estimated that 58,100 alligator nests were present in coastal marsh habitats (a 22% increase from 2015). The 2016 nest survey is the highest nest count on record (Figure 1).

Nest density and alligator population estimates are combined with a detailed review of harvest parameters and a general assessment of environmental factors observed during each survey to determine final harvest level objectives. Over 50 individual alligator harvest quotas are developed annually in order to distribute the harvest in relation to

**Figure 1. Louisiana Coastal Marsh Alligator Nest Production, 1970-2016**

alligator abundance in the various habitats across the state. A listing of the 2016 wild alligator harvest quotas is appended as Exhibit 1. In the best habitat one alligator is harvested per 55 acres, while in the poorer habitats one alligator is harvested per 400 acres.

Alligator hunters annually submit a description of the property on which they have permission to hunt. The Department assesses the habitat quantity and quality and determines the number of alligators that can be harvested by each hunter. This methodology ensures that alligators are harvested in proportion to their population levels and that the harvest will not negatively impact populations at any location. The currently approved quota system represents an allowable wild alligator harvest, which coupled with the state authorized wild alligator egg harvest program represents a level of population utilization currently unparalleled in the world of crocodilian management.

Under this sustained use alligator program, over 1,000,000 wild alligators have been harvested since 1972 (Table 2). The annual harvest takes place in September to specifically target the adult males and immature segments of the alligator population. Adult females, which typically inhabit interior marshes in September, would be more susceptible to harvest if the season was scheduled during the spring or summer. During the 2016 wild season, a total of 33,613 alligators were harvested by 3,281 licensed alligator hunters. Alligators harvested averaged 7.51 feet in length (Figure 2), with an estimated value of \$9.6 million.

Each year the alligator program staff works closely with landowners and alligator hunters to provide assistance regarding alligator management on their respective properties. We have provided numerous habitat base maps to landowners for their use in participation of both the wild and alligator egg harvest programs. Harvest reports summarizing average lengths and size class frequency distribution of harvested alligators are available upon request.

**Figure 2. Louisiana Wild Alligator Harvested, 2016 Regular Harvest Skin Lengths**

## Farming/Ranching Program

Early alligator farms in Louisiana were generally small, family owned operations; and often run more as a hobby/curiosity than a commercial enterprise. Extensive studies done by Department biologists showed alligators could be efficiently cultured and grown in captivity. Egg ranching (collection of alligator eggs from the wild) proved more economical and successful than captive breeding; private egg collections were first permitted, on a limited basis, in 1986.

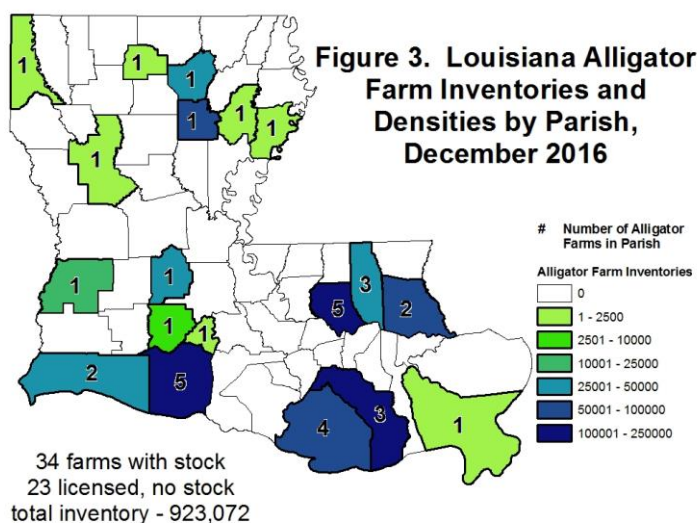

Louisiana's alligator ranching program increased dramatically between 1986 and 1990. To ensure wild alligators were not depleted as a result of egg collections, and to ensure future recruitment of sub-adult alligators to the breeding population, the Department currently requires a quantity of juvenile alligators equal to 12% of the eggs hatched by the rancher be returned to the wild within two years of hatching; this was decreased to 10% with the 2017 year egg permits.

A variable return rate was established based on the estimated survival rates for wild juvenile alligators. Using the relationship of survival between size classes, we extrapolated return rates based on expected survival rates for alligators from 36 to 60 inches. More alligators must be returned if the average total length is smaller, and fewer animals are required if the average length is larger. Close monitoring of the survival of these alligators will continue for many years.

Enormous effort has been made by the Department to monitor the fate of the alligators released to the wild. In 2016 we released a total of 58,106 farm raised alligators into the wild to maintain wild alligator populations. Each alligator released is measured, sexed, tail-notched, tagged and recorded prior to release to the same area where the farmers had originally harvested the eggs. Although it is costly to the ranchers to fulfill the “returns to the wild” obligation, it is an integral necessity of the program, considering the large number of eggs collected. In 2016, a total of 616,546 wild alligator eggs were collected producing 548,416 hatchling alligators (Table 3).

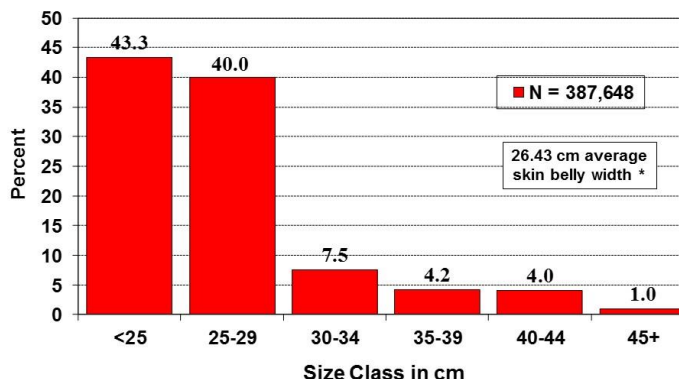

As of January 2017 there were 56 licensed farmers in Louisiana with on farm inventories totaling 923,072 alligators (Figure 3).

During the 2016 tag year (January 2016 through December 2016) an estimated 328,852 farm-raised alligators were harvested, averaging 26.19 cm in belly width (Figure 4). The total estimated value of these alligators was \$74.7 million (Table 4).

Beginning late winter and continuing into spring and summer of 2009, the worldwide economic recession significantly impacted world trade in raw and tanned alligator skins and manufactured products. Egg harvest numbers rebounded in 2011 and 2012, although some eggs were lost to coastal flooding in June 2012. Since early 2010, price and demand for both wild and farm-raised alligators has continued to recover. With wild egg collections reaching over 616,000 in 2016, alligator farm inventories have risen above pre-recession numbers in late 2016.

**Figure 4. Louisiana Farm Alligators Harvested, 2016 Skin Belly Widths**

In order to better meet the needs of the alligator industry, the Department sponsors meetings for all segments of the industry (farmers, hunters, and landowners) which gives the industry participants an opportunity to prioritize and discuss the current issues facing the state's alligator industry. The Department also created specific e-mail ([LAalligatorprogram@wlf.la.gov](mailto:LAalligatorprogram@wlf.la.gov)) and website ([www.lagatorprogram.com](http://www.lagatorprogram.com)) addresses for the alligator program to provide additional and easier methods for alligator industry participants and the general public to ask questions and acquire information. Alligator program staff members continue to compile and update contact information, including e-mail addresses, which are used to promptly notify participants of available and arising program information. In addition to the on-site visits, the staff communicates with farmers on a regular basis to schedule releases, hide inspections, live animal inspections, coordinate farm transfers, alligator egg collection permits, and to issue and follow up on CITES harvest tags.

The Department contracts with the LSU School of Veterinary Medicine to provide various services to the alligator industry. On occasion the staff arranged for transportation of sick or problem alligators and sample skins from farms to the LSU Vet School for necropsy or skin evaluation.

**Alligator program webpage**

One of these contracts provides for the availability of a veterinarian respond to farm related problems. Farmers routinely contact Alligator Program staff or Dr. Javier Nevarez and get a rapid response to their problem. We also arranged collection and delivery of alligator research specimens to numerous graduate students and university faculty.

Despite setbacks from Hurricanes Rita and Ike, numerous wildlife groups, including university faculty and students, were hosted at Rockefeller Wildlife Refuge for educational purposes; as were professional representatives from domestic and international organizations. Presentations were made at various civic organizations and captive alligators were often loaned out for educational purposes.

## **Nuisance Alligator Program**

The Louisiana Department of Wildlife and Fisheries manages a statewide nuisance alligator control program. The nuisance program is designed to remove problem alligators in order to avoid potential human/alligator conflicts. Through the process of nuisance alligator hunter appointments and annual renewals the Department maintains a statewide network of qualified nuisance alligator hunters. Nuisance alligator complaints are phoned into various Department offices, where complaints are recorded and then forwarded to a nuisance alligator hunter in the vicinity of the complaint. Nuisance hunters respond promptly and catch and remove the alligator as deemed necessary. Hunters are allowed to harvest the nuisance alligator and to process the meat and skin of the alligator for commercial sale. This process provides for immediate response to problem alligators and for payment to the nuisance alligator hunter, thereby minimizing the program operating costs to the Department. In 2017 low hide prices presented challenges to retention of nuisance trappers, despite the Department authorizing trappers to charge up to \$50 to respond to a nuisance alligator situation.

During 2015-16, a total of 55 nuisance alligator hunters were enrolled in the program; annually the nuisance hunters respond to several thousand complaints and harvested approximately 2,500 alligators.

## **Research Activities**

The following list provides a summary of the various research and monitoring projects that the alligator program staff conducted and/or participated in during the 2016-2017 fiscal year.

### **Monitoring**

**1. Evaluation of survival, growth, and reproduction in farm released alligators** - This activity involves numerous projects related to survival analysis, growth, and reproductive success (farm-released vs. native wild). Due to the reduction of the release rate percentage, it is imperative to monitor survival closely. The 12% return rate started with the 2007 permits

(releases “due” in 2009); and this was decreased to 10% starting with the 2017 year permits. Information on size class frequency distribution of wild alligator populations and susceptibility to harvest is provided annually to enhance survival estimates. Although some growth information has been published we plan to evaluate growth rates in more detail; we now have “re-traps” that were captured over 20 years since release, and this is undoubtedly one of the largest mark-recapture projects currently in progress. Previously staff from the LSU Department of Experimental Statistics assisted with annual evaluation of survival and growth based on farm “re-traps” recovered in September harvests. We worked with contractors from LSU’s School of Renewable Natural Resources providing input as to analyses on this project, which included a graduate student Master’s degree project. The graduate student made several presentations of preliminary results at scientific conferences, including the Annual Conference of the Southeastern Association of Fish and Wildlife Agencies, which was hosted by LDWF in October 2016.

**2. Coast wide nest survey** - The annual coastal nesting survey is essential for monitoring our alligator population, and is used annually to determine wild alligator and wild alligator egg harvest quotas (for the adult harvest each September as well as egg ranching quotas). This is an integral part of our required “finding of no detriment” needed to achieve for export authorization by the USFWS.

**3. Evaluation of statewide harvest program** - We continue to analyze size class frequency distribution, average size, sex ratios, etc. for alligators harvested each year. During the 2016 wild season staff collected sex ratio data on 16,875 alligators (67.03% males, 32.96% females) which represented a significant percentage of the total alligators harvested. This project, coupled with coastwide nest survey provides critical information regarding the status of the wild alligator population. Data generated from these projects provides the basis for evaluating the impact of our current harvest strategies and for establishment of annual wild harvest quotas.

**4. Evaluation of alligator nest density** - LDWF biologists work with cooperating alligator farmers to gain access to their GPS data from annual egg collections. This data will facilitate comparisons between our coastwide nest survey and estimates of nest density as recorded by the farmer during egg collections. Some farmers have advised staff of reduced nest production on selected wetlands; close review of this nesting production data will allow us to evaluate nest distribution and density changes over time.

**5. West Nile Virus (WNV)** - The Department, in conjunction with LSU School of Veterinary Medicine (LSUSVM), continues to monitor occurrence of WNV on alligator farms in Louisiana. Initial mortality related to WNV occurred in fall/winter 2003. Aggressive mosquito control on farms has reduced on farm mosquito populations and seems to have reduced the incidence of WNV in recent years. During fiscal year 2016-2017 we continued to have expertise from staff at LSUSVM available if needed to collect samples from farm alligators to monitor for any health

concerns, provide diagnostics as needed, and assist with other health surveillance parameters. After several years of research, development, and testing, a WNV vaccine was developed, gained conditional approval by the USDA and became available to farmers in October 2011. Several farmers have taken advantage of this new proactive technology to prevent WNV in captive hatchling and yearling alligators.

**6. Best Management Practices** - The Department of Wildlife and Fisheries and the LSU School of Veterinary Medicine in conjunction with the Louisiana Alligator Farmers and Ranchers Association developed a document entitled “Best Management Practices for Louisiana Alligator Farming”. The document was distributed in June 2011 and details recommended practices to ensure animal welfare of captive reared alligators in Louisiana, including egg collection, hatching, rearing, release to the wild and euthanasia. This document was updated and distributed in January 2013 and again in January 2016 as new information regarding euthanasia was investigated, and will be updated as any pertinent topic to alligator farming becomes available. The intent of this document is to ensure that licensed alligator farms/ranches are employing humane methods of working with alligators. Through industry contributions, Dr. Nevarez at LSU’s School of Veterinary Medicine has continued to work with LDWF staff to update Best Management Practices as needed. LDWF staff assisted with review of a detailed document on Best Management Practices for all farmed crocodilians last fiscal year; both documents have proved to be valuable resources for industry personnel.

**7. Alligator Research Facility** - After several years of planning and fund raising by industry personnel, construction began on an alligator research facility at LSU’s AgCenter Aquaculture Research Station. Funding for facility construction was provided purely by monetary donations from alligator industry participants including alligator farmers, wetland landowners, tanners, feed manufacturers, alligator hunters and other interested parties. The building is available to

house alligators of various sizes for projects related to all phases of alligator husbandry. LDWF staff has worked closely with alligator producers and feed manufacturers to provide input to identify and prioritize research goals and secure long term funding sources for facility operation. The LSU AgCenter has established an Alligator Research Fund to receive additional donations for funding various research projects. Hatchlings were provided to Dr.

Reigh by LDWF from eggs collected and incubated at Rockefeller Refuge for continued nutrition studies to benefit the alligator farming industry; various diets and feeding regimes are tested and findings disseminated to industry personnel at meetings throughout the year. Eggs were also provided for detailed studies on the effects of supplemental oxygen provided during egg incubation.

The following list provides a summary of the various research and monitoring projects that the alligator program staff conducted and/or participated in during the 2016-2017 fiscal year.

### **Contracts**

- 1. Diagnostic services - LSUSVM (Dr. Nevarez)** - Dr. Nevarez is contracted to provide diagnostic services as needed for the alligator industry. Farmers may consult with Dr. Nevarez at any time for assistance with any alligator husbandry or disease issue. Our staff often assists with logistics and transport of alligators/samples to LSUSVM in Baton Rouge for evaluation. Periodic health surveillance of farm released alligators is conducted to monitor health status of farm alligators released to the wild; a manuscript on these findings is being prepared. Dr. Nevarez and colleagues worked with LDWF to evaluate possible culture of Chlamydia from alligator embryos/eggs this fiscal year.
- 2. LSU School of Natural Resources** - The LSU Department of Experimental Statistics was under contract to provide technical statistical expertise for numerous alligator projects; most importantly the evaluation of survival of farm-released alligators, population trends from nesting survey data, and more recently with hide grade/length correlations. Last fiscal year we transitioned to new statisticians (faculty with the School of Renewable Natural Resources) due to the pending retirement of the prior contract statistician and research associate. A graduate student was recruited and completed her thesis work on modeling survival of farm-released alligators. This contract ended June 30, 2017.
- 3. Nutrition Research – LSU AgCenter, Aquaculture Research Station** – A research contract was established for aquaculture nutritionist Dr. Reigh and his research associate to conduct digestibility studies continue to aid farmers in their farm management; industry support from feed manufactures at Cargill have been instrumental in this process. Research committee meetings are held periodically and projects are outlined for study. Current work is underway evaluating varying levels of oxygen and humidity during incubation for optimum hatchling performance; and specific amino acid requirements during grow-out. A Master's degree student was recruited and is currently doing thesis research on these projects.

### **Other Research**

In addition to LDWF research studies, we continued to support and collaborate with graduate students, post-doctoral research associates, and university faculty with their research studies on numerous projects. Associates from several universities (Harvard University, Yale University, University of North Texas, University of California at San Bernardino, University of Southern California, and Texas Tech University) were hosted at Rockefeller in 2016 - 2017 to collect additional samples for several studies, or we provided samples to them if travel costs were prohibitive. Several collaborators made presentations with LDWF staff as co-authors at

meetings as listed below.

We published several abstracts and full papers this year, one of which was selected for a Publication Award by the Louisiana Association of Professional Biologists. Staff members made presentations on the alligator program at the SEAFWA conference hosted by LDWF in Baton Rouge in October 2016. We also assisted with the student field trip and hosted the Director's retreat.

We also have several manuscripts currently in press or in review; and we serve as manuscript reviewers for multiple scientific journals and review numerous manuscripts each year.

Our research efforts have been hampered in large part by lack of holding facilities for alligators. We had a small functioning laboratory, but the tremendous physical plant losses due to Hurricane Rita in 2005 and Hurricane Ike in 2008 have limited our progress. This lab was a shared room in the maintenance workshop and is now not usable due to repairs to the shop. Our biological staff constructed a cover/awning to the semi-repaired holding tanks, which has helped. Initial work done to supply adequate heat to holding tanks was completed in spring 2009 and minor repairs continued this fiscal year. Frequent water lines breaks occur and holding tanks leak continuously; and temperature control is sporadic and inconsistent. Construction of the new laboratory building and improved alligator holding facilities will aid our research progress in the future.

## **Revenue and Expenditure Information**

In recognizing that the Louisiana alligator industry is a vital aspect of Louisiana's economy and recognizing the many, varied national and international impediments to industry development, and the need to develop and maintain a total alligator conservation program, the Louisiana legislature established the Louisiana Alligator Resource Fund in 1991 (R.S. 56:279). This Act established a dedicated source of revenue intended to help defray the costs of the alligator program within the Coastal and Nongame Resources Division of the Department. The specific goals of the legislation are:

1. To provide salaries and financial support including associated indirect costs for the following positions, to provide a minimum of six full-time technical positions (biologists) and eight nontechnical positions such as computer operators, secretaries, and wildlife specialists existing within the Coastal and Nongame Resources Division of the Louisiana Department of Wildlife and Fisheries.

2. To assist with funding for law enforcement activities associated with the alligator farm industry when surplus funds are available and recommended by the Louisiana Alligator Advisory Council.
3. To assist with funding marketing programs recommended by the Louisiana Alligator Advisory Council when surplus funds are available.
4. To actively fund research on all aspects involved with alligator conservation and to develop the techniques needed to enhance the commercial alligator industry.
5. To assist in funding management of the alligator population through proper management, harvest and farm facility management.

This legislation provides all the enabling language required to establish the Louisiana Alligator Resource Fund including sources of income, investing of the fund, and expenditures from the fund. Further R.S. 56: 253 establishes the alligator hide tag fee and the alligator shipping label fee, specifies the details of collection of these fees, and establishes that these fees shall be no more than \$4.00 per hide or live alligator. R.S.56:256, provides for the collection of a \$0.25 severance tax on each alligator hide taken within the state. R.S. 56:279 C (1) provides that all revenues received by the state from tag fees, alligator shipping label fees, and from the severance tax on alligator skins shall be credited to the Louisiana Alligator Resource Fund.

During the 2012 legislative session, R.S.56:279 was amended to provide that monies, from various additional alligator revenue sources are deposited in to the Louisiana Alligator Resource Fund. House Bill 643 (ACT 131) provided that “*all revenues derived from the sale of alligators, alligator skins, or alligator eggs harvested from department-administered lands, all fees derived from alligator lottery harvest programs on department-administered lands and public waters and all revenues derived from any other alligator related fee*”, be credited to the Louisiana Alligator Resource Fund. The bill also provided that the Office of Wildlife may expend funds from the Louisiana Alligator Resource Fund for alligator program administration. This change resulted in additional revenue for the Louisiana Alligator Resource Fund.

During the 2016-17 FY, \$2,509,809 was deposited into the Louisiana Alligator Resource Fund, a decrease in revenue of \$108,272 from the previous year. Harvest and value of farm raised alligators and harvest of wild alligators remained fairly consistent this fiscal year. The alligator industry should be applauded for supporting these legislative endeavors to create a self-generated source of revenue to develop and maintain the state’s alligator management program. Annual income and expenditure data for the Louisiana Alligator Resource Fund is reported in Table 5.

Table 6 summarizes the Louisiana Alligator Resource Fund expenditures by the alligator management program for FY 2015, 2016 and 2017. Expenditures by the alligator management program totaled \$1,457,815 in 2016-17. This is reflective of the stability in program activities associated with stabilized harvests levels (wild alligators, wild alligator eggs, and farm-raised alligators). Currently the alligator program staff consists of 6 biologists, 2 wildlife technicians (2 permanent, 2 temporary) 2 administrative coordinators, 1 data manager, and 2 to 4 seasonal WAE technicians.

All expenditures from the Louisiana Alligator Resource Fund are provided for in R.S. 56:279. The Department carefully approves and monitors all expenditures to ensure compliance with all legal requirements. The Department's fiscal office can produce a variety of expenditure and budget reports upon request.

## **Habitat Concerns**

One threat or potential limiting factor to Louisiana's alligator population is habitat loss. Because the vast majority of Louisiana's alligators are in the coastal parishes, saltwater intrusion and wetlands/marsh deterioration from numerous causes are very real threats. Additionally, the combined impact of recent hurricanes will likely result in long term reduction of alligator habitat quality in coastal Louisiana.

Vast resources by numerous state and federal agencies have been expended to attempt to limit these losses. Projects to restore/enhance marshes include construction of earthen terraces (to reduce wave action and turbidity), "breakwaters" and protection levees along coastlines, vegetative plantings, marsh restoration, and freshwater diversions. Alligators benefit directly from these efforts to maintain/enhance wetlands. The freshwater diversion projects (Davis Pond and Caernarvon) shift water from the Mississippi River in hopes of re-establishing more favorable salinity conditions for numerous fish and wildlife species. Some preliminary data suggests alligator nesting has improved in the areas enhanced by lower marsh salinity levels. It is critical that habitat changes are monitored, mapped and incorporated periodically into the alligator program. This will ensure that our harvest programs are adjusted accordingly for corresponding alligator population and habitat changes.

## **Summary**

Louisiana's alligator management program has clearly illustrated that controlled sustained use of the species is successful. The wild harvest has been in place for 45 years and the egg ranching program for 31 years and may appear to operate unchanged every year. However, constant adaptations are made to try to improve both programs. Requests by user groups (farmers, egg ranchers, trappers, landowners, buyers, dealers and other industry personnel) are received and considered as the Department strives to safely manage the alligator resource to the benefit of many user groups with varied interests.

Louisiana's alligator industry is unique. It has recognized the importance of establishing a self-generated revenue source to provide the necessary regulatory and management efforts required to effectively manage the alligator resource. The Department will continue to protect the alligator as a resource while striving to ensure long term, sustainable harvest programs. During 2016-17 FY, the Department, through the use of the Louisiana Alligator Resource Fund, has worked toward achievement of the goals established by the Louisiana Legislature.

**Table 1. Louisiana Alligator Season Dates, Area Open, Harvest Level and Tag Cost, 1972-2016**

1 Does not include Salvador WMA harvests from 1972-2003 and Marsh Island experimental, nuisance, and farm harvests from 1972-present.

2 The bonus tag program was initiated in 1999 to increase the overall number of wild alligators harvested without putting any additional pressure on the 6' and over portion of the wild population. The bonus tag program was suspended in 2009.

3 Sale of meat not permitted; La. Health Department regulations first allowed meat sales in 1979.

4 Bone in from 1979-1984, deboned from 1985-present.

5 Worldwide economic recession caused alligator hide demand to decline dramatically.

\_\_\_\_ Subject to change, numbers updated October 25, 2017.

1 Tag year extends from September of the year designated to the next September (example: 1997 = 9/97 to 8/98).

2 Sale of meat not permitted; La. Health Department regulations first allowed meat sales in 1979.

3 Deboned from 1980-present.

4 Average total length for 2007 is 4.08', 2008 is 4.25', 2009 is 4.58', 2010 is 4.42', 2011 is 4.25' and 2012 is 4.25'.

5 Worldwide economic recession caused alligator skin price to decline dramatically.

6 Low harvest resulted from reduced egg collections in 2009 due to worldwide economic recession.

7 2013 was transition year to tag year coinciding with calendar year. 2013 tag year only represent 9/1 to 12/31 (4 months).

— Subject to change numbers updated October 25, 2017.

## ATCHAFALAYA BASIN ALLIGATOR HABITAT

REGION	ACREAGE	DESCRIPTION
A. Henderson Lake	15,000	Bounded on the west by the West Guide Levee, on the North by Little Fardoche Bayou, on the east by the Haha Bay and Gim Slough and on the south by La. Hwy. 3177.
B. Crook Chen Cove- Buffalo Cove	32,000	Beginning at the northwest corner of Attakapas W.M.A.: A line north along Lake Fausse Point Cut to Bayou Benoit; west to the West Guide Levee, north to the East-West Canal located approximately 3 miles south of Catahoula, La.: East approximately 2 miles to canal; southeast on the same canal to Bayou Crook Chene; east to the main channel of the Atchafalaya River; south to the north boundary of Attakapas W.M.A.; west to point of beginning.
C. Spike Bay-Berry Lake	8,000	Beginning at a point 1-1/2 miles northwest of Bayou Sorrel Landing: west along canal 5 miles; south along Spike Bay for 2 miles; east to intersect Bayou Sorrel then continue east along Bayou Sorrel to East Guide Levee; north to point of beginning.
D. Upper Grand River Flats	12,000	Beginning at Upper Grand River Landing: north along East Guide Levee approximately 9 miles to a canal running northwest; northwest along that canal 2-1/2 miles to King's Ditch; south approximately 5 miles to include Billy Little Lakes; southeast approximately 4 miles to intersection of Upper Grand River and Little Tensas Bayou, east along Upper Grand River to point of beginning.
E. Bayou Pigeon-Belle River-Flat Lake	140,000	Beginning at Bayou Pigeon Landing; south along East Guide Levee to Morgan City (excluding Flat Lake); north-northwest along east side of the main channel of Six Mile Lake approximately 10 miles to 21-Inch Canal; northeast on 21-Inch Canal to Bayou Boutte; north on Bayou Boutte to the east boundary line of Attakapas W.M.A.; then north along its east boundary to Grand Lake; north along the east bank of Grand Lake to Keelboat Pass; northeast along Keelboat Pass and Flat Lake Pass to intersection of Williams Canal and a canal running southwest-northeast; northeast along that canal to intersection of Intracoastal Canal (East Guide Levee); south to Bayou Pigeon Landing.
TOTAL ALLIGATOR HABITAT WITHIN BASIN TYPE	207,000	Tags may be issued at the rate of one tag per 320 acres of habitat.

## 2016 NON-MARSH ALLIGATOR TAG ALLOTMENT BY REGIONS

REGION	ACRES OF HABITAT	ALLOTMENT	ACRES/TAG	REMARKS
Public Lakes/Non-Coastal WMAs	115,601	881		Includes public lakes and non-coastal Wildlife Management Areas. Tag allotment may vary depending on alligator populations.
Cypress-Tupelo Swamp	750,625	4,692	160	Swamp habitat outside the Atchafalaya Basin.
Atchafalaya Basin	207,000	647	320	That portion of the Atchafalaya Basin determined to be Cypress-Tupelo swamp containing permanent water as determined by aerial observations as well as approximately 400 miles of travel by boat during April-June, 1985.
<b>GRAND TOTAL</b>	<b>1,073,226</b>	<b>6,220</b>		

Additionally: Any private cypress-lake region habitat or coastal marsh alligator habitat determined by Department personnel to have a reproducing population may be issued tags at the rate of one tag per 80 acres of habitat; exceptionally dense alligator populations on a localized area may be issued tags at the rate of 1 tag per 25 acres of habitat (requires coordination and annual evaluation with Coastal and Nongame Resources or Wildlife Division personnel). In areas containing minimal acreage of isolated parcels of non-contiguous wetland habitat, an individual landowner may apply for an alligator harvest tag to remove an alligator from his property during the open alligator season. Such habitats include fresh marsh, cypress-tupelo swamp, lake habitat, ponds/borrow pits.
