# Executive summary

All crocodylians are listed in either Appendix I or Appendix II of the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) and many are found in international trade for the leather and fashion industry, for meat, and as live animals for breeding operations, food, the pet industry and zoos. This report shows the changing trends in the species involved in this trade since 2009 with special emphasis on the years 2016 to 2018, the most recent three-year period for which there are reasonably complete data.

The species involved in the skin trade are the 'classics' such as *Alligator mississippiensis*, *Crocodylus acutus*, *C. moreletii*, *C. niloticus*, *C. novaeguineae*, *C. porosus* and *C. siamensis*, and the caimans such as *Caiman crocodilus crocodilus*, *C. c. fuscus*, *C. latirostris* and *C. yacare*. More recently, Black Caiman *Melanosuchus niger* has entered the skin trade. In the years since 2009 the skin trade has increased year on year reaching a peak of 1.9 million skins in 2013. The increase was across several species particularly American Alligator from the United States, Nile Crocodile from Southern Africa, Saltwater Crocodile from Australia, Indonesia and Papua New Guinea, Brown Caiman from Colombia and Yacaré from Bolivia, Brazil and Paraguay. Since 2013 the total number of crocodylian skins traded globally has declined year on year but over 4.1 million skins were reported in trade over the three-year period 2016-2018.

Live animal trade involves relatively few individuals except for the Far Eastern trade in Siamese Crocodile *Crocodylus siamensis*. These animals are bred in captivity in Cambodia, Thailand, and Viet Nam, and exported in large numbers to China where they are consumed as food. In the period 2016-2018, over 146,000 live *C. siamensis* were involved in this trade.

Crocodylian meat is traded widely but is particularly favoured in the Far East, especially China and Hong Kong, Special Administrative Region of China (hereafter referred to as Hong Kong, SAR); the top species in trade in the period 2016-2018 were *C. niloticus* and *C. siamensis*. Trade has been relatively stable since 2012.

# Introduction

This report, the twenty-sixth produced by UNEP-WCMC for the International Alligator and Crocodile Trade Study (IACS), examines the international trade in crocodilian skins, with a particular focus on the years 2016 to 2018, but also refers to trends since 2009. It also attempts to identify and highlight problem areas such as apparent discrepancies in reporting and to recommend, where possible, workable solutions. The data used have been obtained from the CITES Trade Database maintained by UNEP-WCMC on behalf of the CITES Secretariat, with additional information provided by the Crocodile Farmers Association of Zimbabwe and the United Nations Food and Agriculture Organisation (FAO).

As in previous IACS reports, this report presents an overview of global trade levels in classic skins (alligators and true crocodiles) and caimans, and a detailed species-by-species analysis of the trade in skins and also of trade in other products such as live animals, meat and teeth. All species within the order Crocodylia are listed in either Appendix I or II of CITES. Of those species specifically mentioned in this report as being in commercial trade, the following are listed in Appendix I: *Crocodylus acutus*, *C. moreletii*, *C. niloticus*, *C. porosus*, *C. siamensis*, *Caiman latirostris* and *Melanosuchus niger*, although some of these species have populations currently listed in Appendix II.

## Data included

This report is based on an analysis of the annual reports submitted by the Parties to CITES for 2009 to 2018 and, where appropriate, data outside of this timeframe are presented to provide historical context. A list of annual reports for 2016-2018 that were included in the CITES Trade Database at the time of analysis (April 2020) is provided (Table 1). Additional data provided by FAO and the Crocodile Farmers Association of Zimbabwe (CFAZ) has been used where the annual report data are missing or thought to be incomplete.

All direct, commercial trade in whole skins and sides, live animals, meat and teeth of crocodilian species has been analysed, with two sides being considered to be equivalent to one skin; trade in skins reported in other sub-units, such as 'tails', or in units of weight, area or length, have been excluded. Re-export trade has not been included in the estimation of annual production. The figures and tables contain information on trade from all sources, including captive-breeding, ranching and wild specimens, unless otherwise specified. Wherever possible, data reported by the producer countries have been used in preference to that reported by importing countries. This is because there may be a time lag between when the export and the import are reported, which could lead to the same skins being counted in different years and thus an overestimation of trade volume. However, where producer countries have failed to submit annual reports, or where exporter-reported trade volumes are substantially less than those reported by importers, importers' data have been used. Many of the transactions have been analysed at the export permit level, and, where possible, importer-reported data have been corrected for year-end trade through permit analysis. The report discusses the key species in trade in taxonomic order, reviewing global trade trends before focussing on trends in trade from individual exporting countries.

## Limitations of data

Incomplete data due to late submission of, or failure to submit, CITES annual reports remains an impediment to conducting trade studies using CITES trade data. Measures have been taken by the CITES Standing Committee to improve compliance with the reporting provisions of the Convention. These include reminders being sent by the Secretariat on behalf of the Standing Committee and a recommendation to suspend trade in CITES-listed species should a Party fail, without providing sufficient justification, to submit reports for three consecutive years (Resolution Conf. 11.17 (Rev. CoP18)). Despite these efforts, some Parties fail to submit annual reports on a regular basis.

According to Resolution Conf. 11.17 (Rev. CoP18), annual reports for trade in 2018 should have been submitted by 31 October 2019. However, at the time of analysis (April 2020), several reports that might contain important crocodylian data had not been received by the CITES Secretariat. These include Argentina (2018), Australia (2017 and 2018), Bangladesh (2017 and 2018), Cambodia (2018), Lao P.D.R. (2017 and 2018), Mauritius (2018), Panama (2017 and 2018), Republic of Korea (2017 and 2018), Uganda (2017 and 2018), Venezuela (2018) and Zimbabwe (2017).

The accuracy of the data is a further limitation to analysis of the trade. The quality of some annual reports was poor as evidenced by comparisons of exporter- and importer-reported data and data obtained from other sources; occasionally skins have been misreported as live animals, while skin pieces, such as back strips, necks, flanks and tails, have often been reported as whole skins. Since the majority of countries trading in crocodylian skins report on a shipment-by-shipment basis, and many importers' reports include the exporters' permit numbers, importer-reported data can be cross-referenced with the original export permit information in order to reduce reporting or typographical errors to a minimum. This type of checking is also useful for cross-referencing end-of-year trade, where an export may be reported in one year and the import of the same shipment reported the following year.

Analysing annual reports is also complicated by the inconsistent way in which the reports are compiled. According to CITES Notification to the Parties No. 2017/006 of 16 January 2017 (now replaced by Notification to the Parties No. 2019/072 Annex 1 of 4 December 2019), Parties may report on the basis of the permits and certificates that have been issued if they are unable to report on the actual number of specimens that entered or left the country. However, reporting based on permits issued may lead to overestimates of trade volume as permits are frequently issued for quantities exceeding those actually traded and indeed, some of the permits may expire without being used. Most Parties still fail to provide any details concerning the basis on which their annual reports are compiled.

Significant improvement in the reporting of crocodylian trade continues; however, the absence of annual reports from certain key producer countries continues to be a hindrance to timely analysis of the trade.

# Overview of global trade in crocodilian skins

The overall volume of world trade in classic crocodilian and caiman skins has been variable over the ten-year period 2009 to 2018, with an average of 1.47 million skins<sup>1</sup> exported annually (Table 2; Figure 1). Between 2009 and 2013 overall global trade appeared to be increasing. The total number of skins entering international trade in 2013 was approximately 1.9 million, an increase of 33 per cent over the previous year. Trade in skins of *Alligator mississippiensis* from the United States of America (hereafter referred to as the United States) increased by nearly 50 per cent over the figure for 2012 and *Crocodylus niloticus* skins from southern Africa increased by 26 per cent. Exports of *Caiman crocodilus fuscus* from Colombia increased by 37 per cent compared to the previous year while *Caiman yacare* exports from Bolivia, Brazil and Paraguay showed an increase of 30 per cent. Despite increased numbers of ‘classic’ skins’ reported in 2014 and 2016, the overall number of skins in trade fell steadily between 2013 and 2017, particularly regarding exports of *Caiman crocodilus fuscus* from Colombia and *Crocodylus novaeguineae* from Indonesia and Papua New Guinea.

Some changes to the species in trade began in the early 2000s with two different species entering the market: captive bred *Crocodylus acutus* from Colombia and Honduras and *Caiman latirostris* from Argentina and Brazil. Trade in these species continues, but in relatively small quantities. The first exports in recent years of wild *Caiman crocodilus crocodilus* skins from Guyana began in 2001 and continued through 2018, while 2005 saw the first exports of ranched *Caiman yacare* from Argentina.

*Crocodylus novaeguineae* production peaked in 2015 but decreased to approximately one-fifth that level in 2017 and 2018. The steady increase in trade in *C. porosus* seen up to 2012 showed a slight decrease in 2013 but recovered to peak at almost 100,000 skins in 2016. Trade in *C. siamensis* averaged 42,800 skins over the decade peaking at over 55,000 in 2013, 2015 and 2018, with most of the skins being produced in Thailand and a smaller proportion in Viet Nam.

The following sections provide a more detailed review of each species and the primary exporter countries involved in the skin trade.

**Table 2. Direct, commercial global exports of skins from the main taxa, 2009-2018**

Taxon	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

Figure 1. Direct, commercial global exports of crocodilian skins, 2009-2018

# Species accounts

## *Crocodylus acutus* American Crocodile

**Colombia** has nine farms registered with CITES for production of this species, which was listed in Appendix I during the focus period, with the exception of 2017 and 2018, after the population of the Integrated Management District of Mangroves of the Bay of Cispata, Tinajones, La Balsa and Surrounding Areas, Department of Córdoba was transferred to Appendix II in 2017. Skin exports began in 2001 with 100 skins from captive-bred animals going to France. Exports of small numbers of skins have continued, rising to 5,295 in 2018. The main importers in 2018 were France, Italy, Germany, the Republic of Korea, and Singapore.

**Honduras** has one registered breeding operation for this species and the first reported trade was of 500 skins imported by Japan in 2003. Permits for the export of 1,004 skins were issued in 2008, but these, and a further 86 skins (totalling 1,090 skins) were exported in 2009. In 2012 Honduras reported exporting 350 skins to El Salvador which appear to have been reimported in 2013. Japan reported the import of 50 skins in 2015 but this was not confirmed by Honduras. No further trade has been recorded.

## *Crocodylus johnstoni* Australian Freshwater Crocodile

No trade in skins of this species has been reported since 2005. Exports from Australia, the only range State, peaked at 3,875 skins in 1993, remained at this level until 1996, and subsequently fell to negligible levels.

## *Crocodylus moreletii* Morelet's Crocodile

Found only in Belize, Guatemala and Mexico, this species was listed in CITES Appendix I until 23 June 2010 when the populations of Belize and Mexico were transferred to Appendix II with a zero quota for wild specimens traded for commercial purposes. Previously Mexico had had three captive-breeding operations for this species registered with the CITES Secretariat. Exports of skins from Mexico have fluctuated from zero in 2010 to a peak of 4,088 skins in 2018 (Figure 2). The main importer was France.

Figure 2. Direct, commercial exports of *Crocodylus moreletii* skins reported by Mexico, 2009–2018

### *Crocodylus niloticus* Nile Crocodile

Over the period 2009-2018, an average of 237,000 *Crocodylus niloticus* skins were exported globally per year, with an increasing trend over the period 2009-2016 but falling back in 2017 and 2018 (Table 3). The section that follows summarises information on exports by range States and other countries with farms capable of commercial skin production. Currently, only three countries have captive-breeding operations registered with the CITES Secretariat: Mali, Senegal and Tunisia each with one registered operation. *Crocodylus niloticus* is listed in CITES Appendix I except for the populations of Botswana, Egypt, Ethiopia, Kenya, Madagascar, Malawi, Mozambique, Namibia, South Africa, Uganda, the United Republic of Tanzania (hereafter referred to as Tanzania), Zambia and Zimbabwe, which are included in Appendix II.

Table 3. Direct, commercial exports of *Crocodylus niloticus* skins from producer countries, 2009-2018

Country	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Botswana	*1,626	*1,500	1,800	1,000	4,000	4,500	1,200	*6,000	3,200	1,600

Key: \* Figure derived from importer-reported data; \*\* Data supplied by FAO; ◆ Data supplied by CFAZ (the Crocodile Farmers Association of Zimbabwe)<sup>2</sup>: these data have been used for the totals.

## Exports by range States

**Botswana:** South Africa reported importing 6,000 skins from captive-bred individuals in 2016 compared to 900 reported by Botswana. Botswana reported exporting 3,200 skins in 2017 and a further 1,600 in 2018. All skins reported by Botswana 2016-2018 were from ranched specimens.

**Central African Republic:** No commercial exports of skins from the Central African Republic have been reported since 1986.

**Congo:** No commercial exports of skins from the Congo have been reported since 1989.

**Ethiopia:** Ethiopia's sole crocodile ranching operation (Arba Minch Crocodile Ranch) is owned and managed by the Ethiopian Wildlife Conservation Organisation (EWCO) which also acts as both the CITES Management and Scientific Authorities. Production appears to be variable and there have been discrepancies between the information contained in Ethiopia's annual reports to CITES, data received directly from EWCO, and information from importing countries. Ethiopia's annual report for 2016 recorded the export of seven ranched skins and a further four in 2017. None were reported in 2018.

**Guinea:** No trade in skins from Guinea has been reported since 1995.

**Kenya:** Kenya reported exporting 5,959 skins in 2016, 8,130 in 2017 and a further 7,946 in 2018 with the main importers being Italy, the Republic of Korea and Singapore. All skins were reported to be from ranching operations.

**Liberia:** Commercial exports of skins from Liberia have not been reported since 1984.

<sup>2</sup> Sue Childes on behalf of CFAZ, *pers. comm.* numerous dates.

**Madagascar:** The situation in Madagascar has long been under review by both the IUCN/SSC Crocodile Specialist Group and the CITES Secretariat. Based on serious concerns raised about the trade, the CITES Standing Committee recommended Parties to suspend trade in *C. niloticus* from Madagascar on 17 June 2010 until further notice (See Notification to the Parties No. 2010/015 and SC63 Doc. 13). This suspension was not lifted until the end of 2014, with importers reporting three skins in that year. Madagascar reported exporting 500 skins to France in 2016, all from captive-bred animals. No exports of skins were reported by Madagascar in either 2017 or 2018.

**Malawi:** Malawi reported exporting 12,097 skins in 2016 and a further 5,449 in 2017. No report has been received from Malawi for 2018 but Italy reported importing 1,242. All, apart from 114 and 414 wild skins reportedly exported to Zimbabwe in 2016 and 2017 respectively, were from ranching operations.

**Mali:** Mali has one captive-breeding operation registered with the CITES Secretariat (Ets Lassana Diaby Cuir et Peaux) that was reportedly established in 1978, but was only registered with CITES in May 2008. Mali reported exports of 107 source 'D' skins to France in 2008 and 15 source 'D' skins to the United States in 2011, but no further trade has been reported since.

**Mozambique:** Mozambique reported exporting a total of 27,021 skins in 2016, 84,245 in 2017 and a further 38,868 in 2018. Most of the skins were reported to be from ranching operations with the main importers in 2018 being Singapore and South Africa.

**Namibia:** Namibia reported exporting no skins in either 2016 or 2017, however Italy reported importing 706 captive-bred skins in 2016 and South Africa reported 130 skins in 2017. These data have been used in Table 3. Namibia reported exporting 250 skins from animals bred in captivity in 2018.

**Nigeria:** No commercial shipments of skins from Nigeria have been reported since 1983.

**Senegal:** There is one farm registered with the CITES Secretariat for captive-breeding of this species that was established in 1995. The only reported commercial trade appears to have been two captive-bred skins exported to Ukraine in 2006, one exported to France in 2008 and seven exported to Spain in 2015.

**Somalia:** No commercial shipments of skins have been reported from Somalia since 1981.

**South Africa:** South Africa reported exporting 37,983 skins in 2016, 64,013 in 2017 and a further 55,076 in 2018. It is known that South Africa has exported skins of animals imported as hatchlings from ranching operations in Mozambique however the number of ranched skins reported in 2017 was only 213 to Japan and none in 2018.

**Sudan:** No commercial trade in skins originating in Sudan has been reported since 2010 and Sudan has no captive breeding operations registered with the CITES Secretariat.

**Tanzania:** Tanzania reported no exports of skins between 2016 and 2018 and no imports of skins from that country have been reported by importers in those years.

**Togo:** No trade in skins has been reported since the early 1980s.

**Uganda:** The Uganda annual report for 2016 shows 500 ranched skins being exported to the Republic of Korea. No report has been received from either the Republic of Korea or Uganda for 2017 or 2018 and no other countries reported importing skins from Uganda in those years.

**Zambia:** Zambia reported exporting 112,374 skins in 2016, mostly to Singapore and Zimbabwe. All skins were from ranching operations and the increase appears to be the result of these operations reducing stock levels<sup>3</sup>. Zambia only reported exporting two skins in 2017 although importers reported 31,853 skins most of which were probably exported in 2016. Zambia reported exporting 10,214 skins of ranched animals in 2018.

**Zimbabwe:** Exports of skins of this species reported by Zimbabwe in its annual reports are in most years substantially lower than those reported by importers and also the figures supplied by the Crocodile Farmers Association of Zimbabwe (CFAZ); the CFAZ figures have therefore been used in this analysis as a precautionary measure (see Table 3). However, it should be noted that not all skins exported from Zimbabwe are produced by CFAZ members and therefore it is likely that no set of figures accurately represents a complete record of Zimbabwe’s skin exports. In 2016 CFAZ reported 113,491 as opposed to 41,753 shown in Zimbabwe’s annual report to CITES. No report has been received from Zimbabwe for 2017 but their report for 2018 gave a higher total than the CFAZ data and these data have been used for 2018 in Table 3.

## Exports from non-range States with commercial crocodile farms

**Brazil:** No exports of *C. niloticus* skins have been recorded from Brazil since 2004.

**Israel:** No imports of captive-bred skins from Israel have been reported since 2015.

**Mauritius:** Mauritius reported the direct export of 100 skins to Zimbabwe in 2016. No further trade has been reported subsequently.

**Thailand:** Thailand reported exporting 323 skins from captive-bred animals in 2016 but none since then. The trade was confirmed by the importer, Italy.

## *Crocodylus novaeguineae* New Guinea Crocodile

Over the ten-year period 2009 to 2018, the total number of skins of this species exported by the main producers, Indonesia and Papua New Guinea, was just over 211,000. Trade decreased to under 17,000 in 2011 but then increased again peaking at just over 39,000 in 2015 then declining rapidly to just over 14,000 in 2016, less than 8,000 in 2017 and under 9,000 in 2018 (Table 4).

**Table 4. Direct, commercial exports of *Crocodylus novaeguineae* skins from producer countries, 2009-2018**

Country	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Indonesia	7,255	7,450	8,846	11,097	*10,169	11,232	13,083	4,294	2,806	905
Papua New Guinea	18,957	17,030	7,786	12,364	15,877	13,750	25,987	9,728	4,843	*7,944
<b>Total</b>	<b>26,212</b>	<b>24,480</b>	<b>16,632</b>	<b>23,461</b>	<b>26,046</b>	<b>24,982</b>	<b>39,070</b>	<b>14,022</b>	<b>7,649</b>	<b>8,849</b>

Key: \* Figure derived from importer-reported data

**Indonesia:** Exports increased steadily from just over 7,000 skins in 2009 to over 13,000 in 2015. However, over the next three years, exports declined steeply to less than 1,000 skins in 2018. Most of the skins exported were from wild-caught animals. The main importer of *C. novaeguineae* skins 2016-2018 was Japan, with other large quantities imported by China and Singapore.

<sup>3</sup> P. Reilly *pers com.* to J Caldwell. 08/05/2018

**Papua New Guinea:** Exports over the decade were highest in 2015 but, as with Indonesia, declined dramatically in 2016 and 2017. No report has been received from Papua New Guinea for 2018 so data from importing countries has been used in Table 4. These suggest an increase over the 2017 figure but still well below pre-2015 levels. Apart from 3,149 skins in 2015, all skins exported by Papua New Guinea since 2004 appear to have been wild-sourced although Japan reports importing some skins with no specified source.

## *Crocodylus porosus* Saltwater Crocodile

During the period under review, *Crocodylus porosus* was listed in CITES Appendix I, except for populations of Australia, Indonesia and Papua New Guinea which were listed in Appendix II. In 2017, the population of Malaysia was transferred to Appendix II<sup>4</sup>. The total number of *C. porosus* skins in trade has fluctuated from 45,000 skins in 2009 to a peak of nearly 100,000 skins in 2016. Exports of *C. porosus* skins from range States between 2009 and 2018 are presented in Table 5.

**Table 5. Direct, commercial exports of *Crocodylus porosus* skins from range States, 2009-2018**

Country	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

Key: \* Figure derived from importer-reported data

**Australia:** Comparison of data reported by Australia with that reported by importing countries in certain years suggests that Australia may not have reported the full quantities of skins exported. Given these discrepancies, and the lack of annual reports for both 2017 and 2018, the data provided in Table 5, apart from that for 2015 and 2016, have been taken from reports of the importing countries. The destinations of the skins exported 2016-2018 were mainly France, Japan and Singapore and the vast majority were reported as being from ranched individuals.

**Bangladesh:** This country has one farm registered with the CITES Secretariat in 2007. The stock are from animals bred in captivity in Malaysia. The first reported export was of 430 skins exported to Japan in 2014 with a further 400 exported in 2015. The 2016 annual report from Bangladesh for 2016 showed no further exports of skins but Japan reported importing 600 skins. Japan reported importing no skins in 2015 so the difference, 200 skins, has been used in Table 5. No report has been received from Bangladesh for 2017 or 2018 and no countries have reported importing skins from there.

<sup>4</sup> See <https://cites.org/eng/app/appendices.php> for further details.

**Brunei Darussalam:** This country reported exporting five skins from captive-bred animals to the Republic of Korea in 2012; no other trade in skins from the country has been reported. There are no breeding operations in the country registered with the CITES Secretariat.

**Indonesia:** Indonesia's exports showed a relatively steady increase, peaking at over 9,000 skins in 2014 but have been less in the four subsequent years. The main importers 2016-2018 were Japan, Singapore, and Thailand. From 2006 onwards, all skins were from either captive-bred or ranched animals, with the proportion from captive-bred sources increasing from less than 20 per cent in 2005 to 90 per cent in 2018.

**Malaysia:** Data from Malaysia came from at least two separate Management Authorities and appear to have been poorly correlated with data reported by importing countries for the years 2009 to 2013. The figures for those years provided in Table 5 are based on importer-reported data. Trade has shown a steady increase since 2012, peaking in 2018, with the main importer being Singapore. Until the species was transferred to Appendix II there were seven CITES-registered captive-breeding operations for this species in Malaysia.

**Papua New Guinea:** Papua New Guinea's exports peaked at 15,787 skins in 2010, of which 68 per cent were from animals bred in captivity. Exports have since fluctuated annually but decreased to under 7,000 skins in 2017. No report for 2018 has been received from Papua New Guinea for 2018 but data from importing countries suggest exports had risen to over 13,000. The main importers were France, Japan, and Singapore. The proportion of captive-source skins rose from 72 per cent in 2011 to 78 per cent in 2012 but fell to 30 per cent in 2015. In the three-year period under review 81 per cent of the skins were reportedly from animals bred in captivity.

**Philippines:** There are two farms registered with the CITES Secretariat to produce this species and small quantities of skins have been exported annually since 2007. In 2013 just over 3,000 skins, all of which were recorded as source 'D', were exported Singapore. Philippines reported exporting 9,369 skins to Singapore in 2014 however Singapore reported importing 4,624 skins and 5,750 skin pieces in 2014. Given the perhaps unlikely almost three-fold increase reported by the Philippines, and the wide discrepancy between the importer's and exporter's data, importer-reported data have been used in Table 5 for 2014 to 2018.

**Singapore:** All of Singapore's reported commercial exports of skins 2009-2018 were captive-bred; there is now only one registered captive-breeding operation in the country. Most of the skins were exported to France, Italy, and Japan. No exports were reported between 2009 and 2012 (Table 5), however exports in 2013 were reported to be 11,275. However, neither the 600 skins reportedly going to Hong Kong, SAR and the 10,585 destined for Thailand were reported by the importers so it seems likely that the total export was 90 skins that was confirmed by Japan. Singapore reported exporting 5,739 skins to China and France in 2016, 150 skins to China and Japan in 2017, and 244 skins to China, Italy, and Japan in 2018.

**Thailand:** Thailand's reported exports of skins increased steadily between 2009 and 2014 and appear to have fluctuated since then around 7,000 skins each year apart from a drop to 4,504 in 2017. The principal importers between 2016 and 2018 were France and Japan. There are currently 16 CITES-registered captive-breeding operations for this species in Thailand.

## *Crocodylus siamensis* Siamese Crocodile

**Cambodia:** Cambodia has 21 crocodile farms registered with the CITES Secretariat for the commercial production of this species. Cambodia reported exporting 5,720 skins in 2016 and 4,652 in 2017, all of which were captive bred. The main importer was Thailand. No report has been received from Cambodia for 2018 but Japan and Thailand reported importing 3,469 skins.

**Thailand:** There are 27 crocodile farms registered with the CITES Secretariat for commercial production of this species in Thailand and all reported exports of skins were captive bred. Reported exports peaked at 39,000 skins in 2008 and fluctuated between 25,000 and 36,000 until 2016 when they decreased to under 15,000 for the first time since 2003. In 2017 and 2018 they declined further to around 12,100. Thailand's annual report for 2013 revealed several instances where Thailand reported exports of skin pieces which were reported as whole skins by several importing countries. Therefore, importer reported data has been used for Thailand for 2013, to take a precautionary approach. The main importers over the period 2016 to 2018 were France, Japan, and Singapore.

**Viet Nam:** Since the first reported exports of *C. siamensis* from the country in 2004, exports steadily increased to a peak of 23,062 skins in 2008. Exports subsequently declined and fluctuated between just over 3,000 skins in 2010 and 18,500 skins in 2017 (Table 6). In 2018 there was a large increase in reported skins, totalling over 40,000 mostly to China and Thailand. Although Viet Nam submitted a report for 2014 it is thought to contain an error, so importers' data have been used for that year. China, Japan, Singapore, and Thailand have been the main destinations of the skins. All skins exported were reported as captive-bred; Viet Nam has nine captive-breeding operations registered with the CITES Secretariat for this species.

Table 6. Direct, commercial exports of *Crocodylus siamensis* skins from range States, 2009-2018

Country	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Cambodia	*300	0	0	0	10,000	7,602	19,050	5,720	4,652	*3,469

Viet Nam	9,483	3,285	6,602	6,280	9,319	*14,513	12,594	13,041	18,503	40,112
<b>Total</b>	<b>34,373</b>	<b>33,094</b>	<b>38,170</b>	<b>35,450</b>	<b>55,776</b>	<b>48,557</b>	<b>58,558</b>	<b>33,349</b>	<b>35,339</b>	<b>55,750</b>

Key: \* Figure derived from importer-reported data

## *Alligator mississippiensis* American Alligator

Reported exports of *A. mississippiensis* from the United States increased from around 31,000 skins in 1986 to 422,931 skins in 2006. Although exports declined the following two years, they have subsequently increased steadily and in 2018 nearly 600,000 skins were exported (Table 7; Figure 3). Between 2016 and 2018, four countries, France, Germany, Italy, and Singapore, together imported 95 per cent of production.

Table 7. Direct, commercial exports of *Alligator mississippiensis* skins reported by the United States, 2009-2018

2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
297,187	369,731	312,542	326,538	481,304	485,884	428,521	553,371	463,466	596,258

Since 2005 onwards, source code 'W' (wild taken) appears to have been used for ranched animals obtained from eggs collected in the wild and over 99 per cent of the skins exported now are reported

as source 'W'. This is the result of the decision by the United States CITES Management Authority that the code 'R' should only be used in the case of crocodylian populations transferred from CITES Appendix I to Appendix II subject to ranching. Between 2016 and 2018 nearly 10,000 of the skins exported were reported as source 'I' (seizures/confiscations).

This species is also bred in captivity in Israel, but there have been no reported exports of skins from Israel since 2001.

Figure 3. Direct, commercial exports of *Alligator mississippiensis* skins reported by the United States, 2009-2018

### *Caiman crocodilus crocodilus* Spectacled Caiman

**Colombia** regularly exports small numbers of skins from the nominate subspecies. Between 3,000 and 6,200 captive-bred skins were reported every year between 2004 and 2008 to Singapore and Thailand; no exports were reported by Colombia between 2009 and 2011 but 3,000 skins were reported as exports to Thailand in 2012 and a further 663 in 2013. None have been reported subsequently, however Japan reported the import of 5,715 skins from Colombia in 2016 and 2,200 in 2017.

**Guyana** was a major supplier of this subspecies in the late 1980s, with over 320,000 skins reported by importing countries between 1983 and 1989, but exports dwindled during the 1990s and early 2000s. Trade has increased in recent years with reported exports of 16,460 skins in 2011, 18,000 in 2012, 1,500 in 2013, 18,500 in 2014 and 20,000 in 2015. No skin exports were reported by Guyana or importing countries in 2016 but Mexico reported importing 16,000 in 2017 and Guyana reported a further 10,000 skins to Mexico in 2018. All skins were wild-sourced. For 2013, Mexican annual report data suggest that Guyana underreported that year, so the Mexican data have been used in Table 2.

**Venezuela** has historically been the main supplier of skins of this subspecies, almost all from wild-collected animals. Between 2009 and 2018 Venezuela exported an average of 21,000 skins annually; however, exports appear to have been steadily increasing since 2013 (Figure 4). The importers of skins from Venezuela are Germany, Italy and Spain.

Figure 4. Direct, commercial exports of *Caiman crocodilus* skins reported by Venezuela, 2009-2018. Importer-reported data were used for 2009 and 2018.

## *Caiman crocodilus fuscus* Brown Caiman

Reported exports of *Caiman crocodilus fuscus* skins from the two principal exporting countries between 2009 and 2018 are provided in Table 8.

Table 8. Direct, commercial exports of *Caiman crocodilus fuscus* skins from Colombia and Panama, 2009-2018

Exporter	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Colombia	405,386	647,565	634,461	625,128	855,791	735,779	516,202	367,415	308,174	364,309
Panama	1,730	3,556	300	0	1,324	2,622	14,155	1,100	0	*1,764
<b>Total</b>	<b>407,116</b>	<b>651,121</b>	<b>634,761</b>	<b>625,128</b>	<b>857,115</b>	<b>738,401</b>	<b>530,357</b>	<b>368,515</b>	<b>308,174</b>	<b>366,073</b>

Key: \* Figure derived from importer-reported data.

**Colombia** remains the major exporter of this subspecies. Exports increased steadily from 405,386 skins in 2009, the smallest quantity exported since 1992, to nearly 650,000 in 2010 and remained at over 600,000 in both 2011 and 2012 (Table 8). In 2013 the figure increased to over 850,000 skins but then decreased rapidly over the next four years. Mexico, the Republic of Korea, Singapore, Thailand, and the United States have been the primary importers with Viet Nam also importing a large quantity in 2017 and 2018.

Figure 5. Direct, commercial exports of *Caiman crocodilus fuscus* skins reported by Colombia, 2009-2018

**Other range States:** No exports have been reported by Honduras since 1998; Nicaragua reported the export of one wild-sourced skin to Italy in 2006, while the United States reported the import of 134 wild-sourced skins from Nicaragua in 2008.

Panama, although an important entrepôt State for skins coming from other countries, clearly distinguishes between exports and re-exports in its annual reports. The first significant direct export of 10,250 skins was reported in 2000 and trade appears to have peaked in 2003 at 19,840 skins. Export quantities reported by Panama have been considerably less over the decade under review although it should be noted that the export of 12,155 skins reported as exports to Spain in 2015, and included in Table 8, were not reported by the importer. No skins were reported in 2017. Panama's main trading partners in recent years have been Spain and Thailand.

## *Caiman latirostris* Broad-snouted Caiman

The Argentine population of this species was transferred from CITES Appendix I to Appendix II in 1997, and the first exports of skins from ranched animals were reported by Argentina in 2001. Argentina reported exporting 5,473 ranched skins in 2016 and 3,652 in 2017; no report has been received from Argentina for 2018 but importing countries, Germany, France, Spain and the United States, report 2,811 skins.

Brazil reports exporting small numbers of skins from captive-bred animals most years. Recently this has amounted to two skins to Switzerland and 50 skins to Italy in 2016 and a further 12 to Italy in 2018.

## *Caiman yacare*<sup>5</sup> Yacaré

Exports of *C. yacare* skins from the principal exporter of this species, Bolivia appear to have increased since 2011, peaking in 2015 (Table 9).

**Table 9. Direct, commercial exports of *Caiman yacare* skins from producer countries, 2009-2018**

Exporter	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Argentina	10,204	4,391	3,159	*2,037	607	*37	*3,105	*2,055	*1,510	0
Bolivia	29,535	24,192	48,616	86,914	69,646	84,970	112,379	43,492	52,043	29,734
Brazil	9,114	1,105	6,601	19,623	22,280	*4,910	*12,719	*6,162	11,690	2,219
Paraguay	0	0	0	2,504	22,750	*4,539	0	1000	0	0
<b>Total</b>	<b>48,853</b>	<b>29,688</b>	<b>58,376</b>	<b>111,078</b>	<b>115,283</b>	<b>94,456</b>	<b>128,203</b>	<b>52,709</b>	<b>65,243</b>	<b>31,953</b>

Key: \* Figure derived from importer data

**Argentina:** Reported exports were at their highest in 2009; exports then declined to negligible quantities between 2012 and 2014 but importers' data suggest an increase in 2015 (Table 9). Argentina reported exporting fewer skins in 2015 – 2017 than importing countries. The main destination of the skins was Mexico and the United States, and most of the skins were reported to be from ranching operations.

**Bolivia:** Reported exports have shown a steady increase between 2009 and 2015 but have decreased subsequently (Table 9). The principle importers 2016-2018 were Italy (52%) and Mexico (34%) with other large quantities imported by Germany and Spain. The source of the skins was from captive breeding, ranching and wild caught however Bolivia has reported no exports of skins from animals bred in captivity since 2015. The percentage of wild skins was 81 per cent in 2015 but this fell to 63 per cent in 2016 and to 52 per cent in 2017, the remaining skins apparently coming from ranching operations. In 2018 wild-sourced skins accounted for 90 per cent of exports.

**Brazil:** For 2015 the data from Mexico far exceeds that reported by Brazil and have been used in Table 8. While all skins exported in 2010 were captive-bred and primarily destined for Colombia, most of the skins traded in subsequent years were reported as coming from ranching operations and exported more widely with the main importing countries being Mexico and the United States.

**Paraguay:** Paraguay imposed a moratorium on all exports of wildlife in September 2003 as a result of the findings of a technical mission from the CITES Secretariat. This moratorium was partially lifted in 2009 (CITES Notification to the Parties No. 2009/036 of 10 August 2009) and further partially lifted in 2011 (CITES Notification to the Parties No. 2011/009 of 19 January 2011) to allow exports of existing stocks of skins legally acquired in 2001, 2002 or 2003 once the CITES Secretariat, in cooperation with the IUCN/SSC Crocodile Specialist Group, had confirmed their legal origin. No exports of skins were reported in trade until 2012, when Paraguay exported 2,506 skins, mostly to Spain. In 2013 Paraguay exported 22,750 skins, all of which were wild-sourced. The moratorium was fully lifted in 2014 (CITES Notification 2014/009 of 10 February 2014) during which year 4,539 skins were reported by importers (Spain and the United States). Paraguay reported exporting 1,000 wild skins to Bolivia in 2016 but none have been reported since then.

<sup>5</sup> According to CITES Standard nomenclature, which the CITES Trade Database follows, *Caiman yacare* is a synonym of the sub species *Caiman crocodilus yacare*, and as such trade reported as *Caiman crocodilus* may include trade in the subspecies.

## *Melanosuchus niger* Black Caiman

The Brazilian population of this species was transferred from CITES Appendix I to Appendix II in 2007. Brazil reported the export of 190 skins to Argentina and 100 to Italy in 2014 and a further 584 skins to Argentina in 2015. No skins were exported in 2016 or 2017 but in 2018 Brazil reported exporting 1,044 skins, all sourced from the wild, to Mexico.

## All other crocodylian species

There have been no reported commercial exports from range States between 2009 and 2018 of skins of the following taxa: *Crocodylus cataphractus*, *C. intermedius*, *C. palustris*, *C. rhombifer*, *Alligator sinensis*, *Osteolaemus tetraspis*, *Paleosuchus palpebrosus*, *P. trigonatus*, *Gavialis gangeticus* or *Tomistoma schlegelii*. In 2017 Venezuela reported exporting 202 wild-sourced skins of *Crocodylus intermedius* to the United States for scientific purposes but it seems likely that these were skin samples rather than whole skins

# Trade in live animals

The commercial export of live crocodylians outside of their range States poses a potential threat to the natural biological diversity of the importing countries, particularly if naturalized populations become established. Indeed, Spectacled Caiman, possibly discarded pet animals, can currently be found in Florida and the Everglades National Park where damage to natural fauna is being reported. The continued growth of the crocodylian farming industry means that such threats are likely to continue and should be guarded against.

Live crocodylians are traded for many purposes. Young animals are frequently kept as personal pets; circuses and zoos regularly exhibit such creatures and there are well-established crocodile breeding establishments in countries such as Denmark, France, Morocco, Spain, and Thailand. Crocodile farms and ranches import animals to supplement their gene pool and some animals are imported by range States to strengthen wild populations. This variety of use, and the limited number of possible purpose codes used in CITES annual reports, means that some conclusions drawn from analysis of CITES data are only tentative. For example, the purpose code 'T', which indicates a commercial transaction, could apply equally if the animals were destined for either the pet trade or the farming industry. Below we consider the reported trade in live animals on a species by species basis.

## *Alligator mississippiensis*

The United States reported exporting two live animals to Canada and five to Spain (source 'F') and a further two wild-caught specimens to United Arab Emirates in 2016. In 2017 eight source 'F' animals were exported to Spain and a further one in 2018. Most of the trade was reported as being for commercial purposes.

## *Alligator sinensis*

In 2017 China exported four animals to Japan, while in 2018 China exported five to the Czech Republic and another 17 to Japan. All were probably destined for zoos despite the purpose code 'T' being reported for the majority.

## *Caiman crocodilus*

**Guyana:** Guyana reported exports of 530 animals in 2016, 220 in 2017, and 698 in 2018. All were wild-sourced.

**Suriname:** This country regularly exports small numbers of wild-caught animals for the pet industry and in 2016 a total of 28 animals were imported from Suriname by Germany and the United Kingdom. Germany reported importing 72 in 2017 and no further trade has been reported for 2018. All were source 'W'.

## *Caiman latirostris*

In 2016 Denmark exported 15 animals to Norway, while in 2018 Norway exported seven animals to Denmark. All were captive-bred and destined for zoos.

## *Melanosuchus niger*

No trade in live animals from range States was reported between 2016 and 2018 although Denmark reported exporting 10 to the United States in 2016.

### *Paleosuchus palpebrosus*

For 2016 to 2018, Guyana published an annual export quota of 500 live, wild-sourced animals. Guyana reported exports of 401 animals in 2016 and 85 in 2017 although import country data put the figure at 346. In 2018 Guyana reported exporting 447 animals. It should be noted that although the annual reports cover the period January to December, the quota year for Guyana runs from April to April. Most of the animals were likely to be for the pet industry (recorded as purpose 'T'), with the main importing countries being Germany and the United States.

### *Paleosuchus trigonatus*

For 2016 to 2018, Guyana published an annual export quota of 1,000 live, wild-sourced animals. Exports reported by Guyana remained below this number, with 858 animals exported in 2016. Guyana reported exporting 400 animals to the United States in 2017 but importing countries report 643. In 2018 Guyana reported exporting 994 animals. Most were reported as purpose 'T', the main importing country being the United States.

### *Crocodylus moreletii*

Twelve animals were exported by Mexico to the United States in 2016 and a further 12, probably to the United States although this was not specified, in 2017. All were captive bred.

### *Crocodylus niloticus*

Mozambique has been exporting hatchlings and juveniles to South Africa since the late 1980s, and more recently to Malawi and Zimbabwe. In 2016 South Africa reported importing 10,000 ranched animals from there and Mozambique reported exporting 6,000 ranched animals to Zimbabwe in 2017. Also, in 2017 South Africa reported exporting 3,000 animals to China who confirmed the import. In 2018 Zimbabwe exported four animals, reportedly wild-caught, to the Democratic Republic of the Congo using the purpose code 'N' for reintroduction to the wild, and a further 10 ranched specimens with purpose code 'Z'.

### *Crocodylus porosus*

Malaysia reported exports of 4,450 to Bangladesh, China, and Thailand in 2016, a further 3,300 to China and Thailand in 2017. In 2018 Malaysia reported exports of 5,042 to Brunei Darussalam, China, Thailand, and the United Kingdom. All reported exports were captive-bred and for purpose 'T'. Also, in 2017 Turkey reported importing two wild-source animals from Australia.

### *Crocodylus rhombifer*

Cuba reported exporting four animals to the Republic of Korea in 2016. In that year Denmark also exported five animals to Norway.

### *Crocodylus siamensis*

Over the decade under review, China has been the principal importer of live specimens of *C. siamensis* and began importing this species from Thailand in 1997, from Cambodia in 2000 and from Viet Nam in 2003. As shown in Table 10, China has imported around 354,000 live specimens from these countries in the ten-year period 2009 to 2018, all of which were captive-bred and the majority for purpose 'T'. Since 2010, imports had been falling with exports from Cambodia and Thailand becoming negligible but those from Viet Nam increasing. Cambodia exported 40,000 animals to Thailand in 2016 and a further 48,000 in 2017.

Table 10. Direct, commercial exports of live *Crocodylus siamensis* to China reported by the exporting countries, 2009-2018

Exporter	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Cambodia	1,400	0	0	0	0	0	2,000	*2,000	0	0
Thailand	16,600	50,200	10,500	330	15	0	0	0	0	2,000
Viet Nam	11,137	10,600	12,000	15,000	23,300	23,770	30,600	63,198	28,700	52,700
<b>Total</b>	<b>29,137</b>	<b>60,800</b>	<b>22,500</b>	<b>15,330</b>	<b>23,315</b>	<b>23,770</b>	<b>32,600</b>	<b>63,198</b>	<b>28,700</b>	<b>54,700</b>

Key: \* Figure derived from importer-reported data.

# Trade in other by-products

## Meat

Total global commercial exports of crocodilian meat, as reported in CITES and CFAZ annual reports from 2009 to 2018, are provided in Figure 6. Between 1990 and 2002, the quantity traded globally fluctuated at around 400 tonnes per year. Exports began an upward trend in 2003, and in 2007 peaked at just under 1000 t. They subsequently decreased to 400 t in 2009 but have been over 600 t per year between 2012 and 2017, falling to just over 500 t in 2018. Global trade averaged just over 600 t during the decade under review.

Since 1988, there have been major fluctuations in the countries and species involved in the meat trade. Until 1992, the main species in trade was *Alligator mississippiensis* from the United States, particularly to Canada, Japan, Taiwan, Province of China, and the United Kingdom. No exports to Taiwan, Province of China have been reported since 1994 and exports of meat from this species have fallen since 1995; the principal importers in 2016-2018 were Canada and Hong Kong, SAR.

Figure 6. Direct, commercial global exports of crocodilian meat as reported by exporters in CITES and CFAZ annual reports, 2009–2018

Exports of *Crocodylus niloticus* meat, which originate mainly from South Africa, Zambia, and Zimbabwe, increased steadily from less than two tonnes in 1992 to over 470 t in 2007, but then decreased to 125 t in 2009. Exports subsequently recovered and were around 250 t in both 2011 and 2012. Despite a drop in 2013 to 133 t, over 200 t was exported each year between 2014 and 2017. In 2018 exports fell to 134 t. As with skin data for Zimbabwe, data provided by CFAZ have been used in preference to the CITES report. Reporting of the crocodile meat trade by southern African countries appears to be of varied quality based on comparisons with importer data. The main destinations for *C. niloticus* meat 2016-2018 were Europe, and Hong Kong, SAR.

Exports of meat of *Crocodylus novaeguineae* are infrequent with under one tonne reported in each of 2010, 2012 and 2015.

Australia's exports of *Crocodylus porosus* meat increased from 53 t in 2000 to 57 t in both 2001 and 2002 but averaged 22 t over the decade under review. The main importer of Australia's production was Japan, with other large quantities imported by New Zealand and Singapore. Thailand imported 200 kg from Cambodia in 2017 and 5 t in 2018. *C. porosus* meat was also traded at relatively low levels from Indonesia with over six t exported in 2016, 13.5 t in 2017 and just under 10 t in 2018. Malaysia appears to export between two and four t annually in 2016-2018, while Papua New Guinea exported 9.5 t in both 2016 and 2017. The Philippines exported 24 kg of meat to the Russian Federation in 2015 and Thailand reported exporting five t in that year.

Until 2005, Thailand was the only exporter of *Crocodylus siamensis* meat and exports had averaged about 35 t annually between 1999 and 2003. Exports from Thailand increased to almost 400 t in 2006 and in the decade under review averaged about 336 t annually. The main importers were China, Hong Kong, SAR and Singapore. Exports of *C. siamensis* meat from Viet Nam decreased from 5.5 t in 2008 to under a tonne annually between 2012 and 2015. An increase to 28.4 t was noted in 2016 but this may have been the result of a typographical error and importers' data suggest the real total was just over 3 t. The totals for 2017 and 2018 were 1.4 and 3.1 t respectively. The main importers were China and Hong Kong, SAR.

## Teeth

Australia is the world's foremost importer of crocodile teeth, importing from Papua New Guinea and Singapore over 86,000 teeth between 2016 and 2018. All the teeth were obtained from *Crocodylus porosus* from captive-breeding operations.

# Declared dollar value

Although CITES annual reports do not usually contain information concerning the value of the trade or of individual shipments, the United States has included this information in its annual reports since 1997. There are great fluctuations amongst the reported values and no indication of the size or quality of the skins is provided; furthermore, for caiman species, flanks may have been reported as whole skins which further complicates interpretation of the data. Values that appear erroneous and are likely to have been the result of typographic errors have been ignored in the analysis below. The average declared value per skin (in US\$) of exports of *Alligator mississippiensis* skins and the reported value of re-imports of these skins from Europe, Mexico and Asia after tanning are provided in Table 11. Although the value of the original exports fluctuates from year to year, the value of the re-imports has been consistently higher. It should also be noted that the average value of the skins exported increased year on year between 2010 and 2015 but has remained stable over the last three-year period.

**Table 11. Reported US dollar value of *Alligator mississippiensis* skins (mean value per skin) exported and re-imported by the United States, 2009-2018**

	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Exports by USA	193.3	136.0	167.5	194.9	241.1	261.6	275.6	241.0	243.5	242.3
Re-imports by USA	394.7	236.9	245.7	260.1	407.5	444.15	391.5	364.8	310.1	391.3

Source: United States annual reports to CITES

Table 12 compares the average value per skin of Colombian *Caiman crocodilus fuscus* imported directly from Colombia and via third countries, as reported by the United States. The re-exporters of skins vary from year to year, but the majority are imported directly from Colombia, or indirectly via Singapore, Europe, and Mexico. The declared value of the direct imports from Colombia increased between 2008 and 2014, were stable for the next two years but decreased in 2017 and 2018. The value of skins imported from third countries showed no specific trends and it should be noted that in 2018 97 per cent of the skins were direct imports from Colombia.

**Table 12. Reported US dollar value of *Caiman crocodilus fuscus* skins (mean value per skin) originating in Colombia and imported by the United States, 2009-2018**

(Re-)Exporter	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Colombia	72.2	65.3	73.4	76.6	79.1	96.8	93.0	97.2	78.4	71.1
European Union	87.3	54.9	71.0	99.9	61.6	58.4	78.4	44.8	56.3	40.9

Source: United States annual reports to CITES

# Reported seizures

Information on seizures is reported inconsistently in CITES annual reports. Furthermore, the data recorded by Customs rarely allow the goods to be identified at the species level. Most of the seizures that are reported are of tourist items such as dried heads, whole stuffed baby crocodiles, etc., and personal imports of manufactured leather goods. Many of the items seized on import are subsequently released to the importer when adequate permits have been obtained. It should be noted that source code 'I' not only covers seizures but the further re-exportation or repatriation of the seized material.

The only significant seizures reported in the period 2016-2018 were 100 skins of *Crocodylus acutus* from Colombia in 2017 and 612 *C. niloticus* skins from Zimbabwe, originating in Zambia, in 2018 both reported by the United States. It is also worth pointing out that the United States reported exporting a total of 6,084 *Alligator mississippiensis* skins for commercial purposes with source code 'I' in 2016, a further nine in 2017 and 3,770 in 2018.

# Recommendations

The following recommendations made in previous IACTS reports remain valid:

- ◆ Countries should, where possible, adopt the CITES standard permit number format which identifies both the exporting country and the year of permit issuance (see CITES Resolution Conf. 12.3 (Rev. CoP18) on Permits and certificates). This would allow for more accurate cross matching of shipments.
- ◆ Standardisation of the terminology used to describe parts of crocodylian skins would reduce the danger of double-counting and subsequent overestimation of trade levels. There is often confusion between hornbacks and back skins for *Crocodylus niloticus* and between whole skins and sides for caiman.
- ◆ As the source of specimens (e.g. wild, captive-bred, etc.) provides critical information for determining the conservation impact of trade, CITES Parties should strive to accurately report the source of crocodylian material as defined in the *Guidelines for the preparation and submission of CITES annual reports* (see CITES Notification No. 2019/072 Annex 1).
- ◆ Countries with large-scale farming operations should establish strict monitoring and management programmes for their wild crocodylian populations, and any farming of non-native species should be strictly regulated to ensure there are no escapes into the wild. Although breeding in captivity can alleviate pressure on wild populations, it can also remove the incentive to preserve them.
- ◆ It is recommended that the CITES Secretariat and the Chairman of the Standing Committee contact Parties in June of each year to remind them of their reporting obligations under Article VIII, paragraphs 6 and 7 of the Convention.
- ◆ Wherever possible, Parties should report the actual quantities of skins being traded and should specify whether their annual report compilation is based on actual trade or permits issued.

# Acknowledgements

The compiler would like to thank the Louisiana Department of Wildlife and Fisheries and the Alligator Advisory Council for funding the IACTS reports since the 1980s. Also Sue Worsley of the Crocodile Farmers Association of Zimbabwe, Luca Garibaldi, formerly of FAO, Paul Reilly of Zongwe Farming Enterprises and Eric Langelet and the staff of Mainland Holdings, Papua New Guinea for assistance with obtaining data, and Jessica Vitale and Becky Price of UNEP-WCMC for reviewing the report.

# Annex: Purpose and source codes

Table 13. Codes for purpose of trade

Code	Description
B	Breeding in captivity or artificial propagation
E	Educational
G	Botanical gardens
H	Hunting trophies
L	Law enforcement/judicial/forensic
M	Medical (including biomedical research)
N	Reintroduction or introduction into the wild
P	Personal
Q	Circuses and travelling exhibitions
S	Scientific
T	Commercial
Z	Zoos

Table 14. Codes for source of specimens in trade

Code	Description
A	Plants that are artificially propagated in accordance with Resolution Conf. 11.11 (Rev. CoP18), as well as parts and derivatives thereof, exported under the provisions of Article VII, paragraph 5 (specimens of species included in Appendix I that have been propagated artificially for non-commercial purposes and specimens of species included in Appendices II and III)
C	Animals bred in captivity in accordance with Resolution Conf. 10.16 (Rev.), as well as parts and derivatives thereof, exported under the provisions of Article VII, paragraph 5
D	Appendix-I animals bred in captivity for commercial purposes in operations included in the Secretariat's Register, in accordance with Resolution Conf. 12.10 (Rev. CoP15), and Appendix-I plants artificially propagated for commercial purposes, as well as parts and derivatives thereof, exported under the provisions of Article VII, paragraph 4, of the Convention;
F	Animals born in captivity (F1 or subsequent generations) that do not fulfil the definition of 'bred in captivity' in Resolution Conf. 10.16 (Rev.), as well as parts and derivatives thereof;
I	Confiscated or seized specimens (may be used with another code)
O	Pre-Convention specimens
R	Ranched specimens: specimens of animals reared in a controlled environment, taken as eggs or juveniles from the wild, where they would otherwise have had a very low probability of surviving to adulthood
U	Source unknown (must be justified)
W	Specimens taken from the wild
X	Specimens taken in 'the marine environment not under the jurisdiction of any State'
